

The package **piton**^{*}

F. Pantigny
fpantigny@wanadoo.fr

August 12, 2024

Abstract

The package **piton** provides tools to typeset computer listings, with syntactic highlighting, by using the Lua library LPEG. It requires LuaLaTeX.

1 Presentation

The package **piton** uses the Lua library LPEG¹ for parsing informatic listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with **lualatex** only (and won't work with the other engines: **latex**, **pdflatex** and **xelatex**). It does not use external program and the compilation does not require **--shell-escape**. The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by **piton**, with the environment **{Piton}**.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
    (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

The main alternatives to the package **piton** are probably the packages **listings** and **minted**.

The name of this extension (**piton**) has been chosen arbitrarily by reference to the pitons used by the climbers in alpinism.

^{*}This document corresponds to the version 3.1a of **piton**, at the date of 2024/08/12.

¹LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

²This LaTeX escape has been done by beginning the comment by **#>**.

2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

3 Use of the package

The package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

If, at the end of the preamble, the package `xcolor` has not been loaded (by the final user or by another package), `piton` loads `xcolor` with the instruction `\usepackage{xcolor}` (that is to say without any option). The package `piton` doesn't load any other package. It does not any exterior program.

3.2 Choice of the computer language

The package `piton` supports two kinds of languages:

- the languages natively supported by `piton`, which are Python, OCaml, C (in fact C++), SQL and a language called `minimal`³;
- the languages defined by the final user by using the built-in command `\NewPitonLanguage` described p. 9 (the parsers of those languages can't be as precise as those of the native languages supported by `piton`).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language`: `\PitonOptions{language = OCaml}`.

In fact, for `piton`, the names of the informatic languages are always **case-insensitive**. In this example, we might have written `Ocaml` or `ocaml`.

For the developers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

3.3 The tools provided to the user

The package `piton` provides several tools to typeset Python codes: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}    def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.

³That language `minimal` may be used to format pseudo-codes: cf. p. 30

- The command `\PitonInputFile` is used to insert and typeset a external file.

It's possible to insert only a part of the file: cf. part 6.2, p. 12.

The key `path` of the command `\PitonOptions` specifies a *list* of paths where the files included by `\PitonInputFile` will be searched. That list is comma separated.

The extension `piton` also provides the commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF` with supplementary arguments corresponding to the letters T and F. Those arguments will be executed if the file to include has been found (letter T) or not found (letter F).

3.4 The syntax of the command `\piton`

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- **Syntax `\piton{...}`**

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),
but the command `_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,
but the command `\%` is provided to insert a `%`;
- the braces must be appear by pairs correctly nested
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands⁴ are fully expanded and not executed,
so it's possible to use `\\"` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

```
\piton{MyString = '\\n'}
\piton{def even(n): return n%2==0}
\piton{c="#"      # an affectation }
\piton{c="#" \ \ \ # an affectation }
\piton{MyDict = {'a': 3, 'b': 4 }}
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4 }
```

It's possible to use the command `\piton` in the arguments of a LaTeX command.⁵

- **Syntax `\piton|...|`**

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

```
\piton|MyString = '\n'|
\piton!def even(n): return n%2==0!
\piton+c="#"      # an affectation +
\piton?MyDict = {'a': 3, 'b': 4}?
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4}
```

⁴That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

⁵For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

4 Customization

With regard to the font used by `piton` in its listings, it's only the current monospaced font. The package `piton` merely uses internally the standard LaTeX command `\texttt{}`.

4.1 The keys of the command `\PitonOptions`

The command `\PitonOptions` takes in as argument a comma-separated list of `key=value` pairs. The scope of the settings done by that command is the current TeX group.⁶

These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). It's possible to use the name of the five built-in languages (`Python`, `OCaml`, `C`, `SQL` and `minimal`) or the name of the language defined by the user with `\NewPitonLanguage` (cf. part 5, p. 9).

The initial value is `Python`.

- The key `path` specifies a path where the files included by `\PitonInputFile` will be searched.
- The key `gobble` takes in as value a positive integer n : the first n characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value n of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n .
- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number n of spaces on that line and applies `gobble` with that value of n . The name of that key comes from *environment gobble*: the effect of `gobble` is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `write` takes in as argument a name of file (with its extension) and write the content⁷ of the current environment in that file. At the first use of a file by `piton`, it is erased.
- The key `path-write` specifies a path where the files written by the key `write` will be written.
- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).⁸
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.⁹
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 6.2, p. 12). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.

⁶We remind that a LaTeX environment is, in particular, a TeX group.

⁷In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 7, p. 22).

⁸For the language Python, the empty lines in the docstrings are taken into account (by design).

⁹When the key `split-on-empty-lines` is in force, the labels of the empty are never printed.

- The key `line-numbers/start` requires that the line numbering begins to the value of the key.
- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is `0.7 em`.
- **New 3.1** The key `line-numbers/format` is a list of tokens which are inserted before the number of line in order to format it. It's possible to put, *at the end* of the list, a LaTeX command with one argument, such as, for example, `\fbox`.
The initial value is `\footnotesize\color{gray}`.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
    line-numbers =
    {
        skip-empty-lines = false ,
        label-empty-lines = false ,
        sep = 1 em ,
        line-format = \footnotesize \color{blue}
    }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 8.1 on page 22.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

Example : `\PitonOptions{background-color = {gray!5,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

When the key `split-on-empty-lines` is in force (see the part “Page breaks”, p. 11), the empty lines generated by that key don't have any background color (at least with the initial value of the parameter `split-separation`).

- With the key `prompt-background-color`, piton adds a color background to the lines beginning with the prompt “`>>>`” (and its continuation “`...`”) characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. 6.1.2, p. 11).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special

value `min` requires two compilations with LuaLaTeX¹⁰.

For an example of use of `width=min`, see the section 8.2, p. 23.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters¹¹ are replaced by the character `\u2423` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.¹²

Example : `my_string = 'Very\u2423good\u2423answer'`

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`¹³ is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by `piton`. The tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C, line-numbers, auto-gobble, background-color = gray!15]
```

```
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
\end{Piton}
```

```
1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }
```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 11).

¹⁰The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `larem` (used by Overleaf) do automatically a sufficient number of compilations.

¹¹With the language Python that feature applies only to the short strings (delimited by ' or "). In OCaml, that feature does not apply to the *quoted strings*.

¹²The package `piton` simply uses the current monospaced font. The best way to change that font is to use the command `\setmonofont` of the package `fontspec`.

¹³cf. 6.1.2 p. 11

4.2 The styles

4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the Python listings. The customizations done by that command are limited to the current TeX group.¹⁴

The command `\SetPitonStyle` takes in as argument a comma-separated list of `key=value` pairs. The keys are names of styles and the value are LaTeX formatting instructions.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It's also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `luatex` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!50] }
```

In that example, `\highLight[red!50]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!50]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by `piton` in the different languages which it supports (Python, OCaml, C, SQL and “minimal”), are described in the part 9, starting at the page 26.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it's possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word `function` formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style `style`.

4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc. or a language defined by the command `\NewPitonLanguage`).

But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.¹⁵

For example, with the command

```
\SetPitonStyle[SQL]{Keywords = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of `group` in TeX).¹⁶

¹⁴We remind that a LaTeX environment is, in particular, a TeX group.

¹⁵We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

¹⁶As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

4.2.3 The style `UserFunction`

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style is empty, and, therefore, the names of the functions are formatted as standard text (in black). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

```
\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color[HTML]{CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}

\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}

def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for i in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

(Some PDF viewers display a frame around the clickable word `transpose` but others do not.)

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.¹⁷

4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.¹⁸

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{O{} }{\PitonOptions{#1}}{}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

¹⁷We remind that, in `piton`, the name of the informatic languages are case-insensitive.

¹⁸However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed.

```
\NewPitonEnvironment{Python}{}  
{\begin{tcolorbox}  
{\end{tcolorbox}}
```

With this new environment {Python}, it's possible to write:

```
\begin{Python}  
def square(x):  
    """Compute the square of a number"""  
    return x*x  
end{Python}
```

```
def square(x):  
    """Compute the square of a number"""  
    return x*x
```

5 Definition of new languages with the syntax of listings

New 3.0

The package `listings` is a famous LaTeX package to format informatic listings.

That package provides a command `\lstdefinelanguage` which allows the user to define new languages. That command is also used by `listings` itself to provide the definition of the predefined languages in `listings` (in fact, for this task, `listings` uses a command called `\lst@definelanguage` but that command has the same syntax as `\lstdefinelanguage`).

The package `piton` provides a command `\NewPitonLanguage` to define new languages (available in `\piton`, `{Piton}`, etc.) with a syntax which is almost the same as the syntax of `\lstdefinelanguage`. Let's precise that `piton` does *not* use that command to define the languages provided natively (Python, OCaml, C++, SQL and `minimal`), which allows more powerful parsers.

For example, in the file `1stlang1.sty`, which is one of the definition files of `listings`, we find the following instructions (in version 1.10a).

```
\lstdefinelanguage{Java}%  
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%  
const,continue,default,do,double,else,extends,false,final,%  
finally,float,for,goto;if,implements,import,instanceof,int,%  
interface,label,long,native,new,null,package,private,protected,%  
public,return,short,static,super,switch,synchronized,this,throw,%  
throws,transient,true,try,void,volatile,while},%  
sensitive,%  
morecomment=[l]//,%  
morecomment=[s]{/*}{*/},%  
morestring=[b]",%  
morestring=[b]',%  
}[keywords,comments,strings]
```

In order to define a language called Java for `piton`, one has only to write the following code **where the last argument of `\lst@definelanguage`, between square brackets, has been discarded** (in fact, the symbols % may be deleted without any problem).

```
\NewPitonLanguage{Java}%  
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%  
const,continue,default,do,double,else,extends,false,final,%  
finally,float,for,goto;if,implements,import,instanceof,int,%  
interface,label,long,native,new,null,package,private,protected,%  
public,return,short,static,super,switch,synchronized,this,throw,%  
throws,transient,true,try,void,volatile,while},%
```

```

sensitive,%
morecomment=[l]//,%
morecomment=[s]{/*}{{}},%
morestring=[b]",%
morestring=[b]',%
}

```

It's possible to use the language Java like any other language defined by piton.

Here is an example of code formatted in an environment {Piton} with the key `language=Java`.¹⁹

```

public class Cipher { // Caesar cipher
    public static void main(String[] args) {
        String str = "The quick brown fox Jumped over the lazy Dog";
        System.out.println( Cipher.encode( str, 12 ) );
        System.out.println( Cipher.decode( Cipher.encode( str, 12 ), 12 ) );
    }

    public static String decode(String enc, int offset) {
        return encode(enc, 26-offset);
    }

    public static String encode(String enc, int offset) {
        offset = offset % 26 + 26;
        StringBuilder encoded = new StringBuilder();
        for (char i : enc.toCharArray()) {
            if (Character.isLetter(i)) {
                if (Character.isUpperCase(i)) {
                    encoded.append((char) ('A' + (i - 'A' + offset) % 26));
                } else {
                    encoded.append((char) ('a' + (i - 'a' + offset) % 26));
                }
            } else {
                encoded.append(i);
            }
        }
        return encoded.toString();
    }
}

```

The keys of the command `\lstdefinelanguage` of `listings` supported by `\NewPitonLanguage` are: `morekeywords`, `otherkeywords`, `sensitive`, `keywordsprefix`, `moretexcs`, `morestring` (with the letters `b`, `d`, `s` and `m`), `morecomment` (with the letters `i`, `l`, `s` and `n`), `moredelim` (with the letters `i`, `l`, `s`, `*` and `**`), `moredirectives`, `tag`, `alsodigit`, `alsoletter` and `alsoother`.

For the description of those keys, we redirect the reader to the documentation of the package `listings` (type `texdoc listings` in a terminal).

For example, here is a language called “LaTeX” to format LaTeX chunks of codes:

```
\NewPitonLanguage{LaTeX}{keywordsprefix = \ , alsoletter = _ }
```

Initially, the characters `\` and `_` are considered as letters because, in many informatic languages, they are allowed in the keywords and the names of the identifiers. With `alsoletter = @_`, we retrieve them from the category of the letters.

¹⁹We recall that, for `piton`, the names of the informatic languages are case-insensitive. Hence, it's possible to write, for instance, `language=java`.

6 Advanced features

6.1 Page breaks and line breaks

6.1.1 Page breaks

By default, the listings produced by the environment `{Piton}` and the command `\PitonInputFile` are not breakable.

However, the command `\PitonOptions` provides the keys `split-on-empty-lines` and `splittable` to allow such breaks.

- The key `split-on-empty-lines` allows breaks on the empty lines²⁰ in the listing. In the informatic listings, the empty lines usually separate the definitions of the informatic functions and it's pertinent to allow breaks between these functions.

In fact, when the key `split-on-empty-lines` is in force, the work goes a little further than merely allowing page breaks: several successive empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`.

- That parameter must contain elements allowed to be inserted in *vertical mode* of TeX. For example, it's possible to put `\hrule`.
- The initial value of this parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break). If the key `background-color` is in force, no background color is added to that empty line.
- Of course, the key `split-on-empty-lines` may not be sufficient and that's why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value n (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the n first lines of the listing or within the n last lines. For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it's probably not recommandable).

The initial value of the key `splittable` is equal to 100 (by default, the listings are not breakable at all).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.²¹

6.1.2 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces in the Python strings).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

²⁰The “empty lines” are the lines which contains only spaces.

²¹With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return.
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+\\;` (the command `\\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$\\hookrightarrow\\;$`.

The following code has been composed with the following tuning:

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}
```

```
def dict_of_list(l):
    """Converts a list of subrs and descriptions of glyphs in \
+       ↪ a dictionary"""
    our_dict = {}
    for list_letter in l:
        if (list_letter[0][0:3] == 'dup'): # if it's a subr
            name = list_letter[0][4:-3]
            print("We treat the subr of number " + name)
        else:
            name = list_letter[0][1:-3] # if it's a glyph
            print("We treat the glyph of number " + name)
            our_dict[name] = [treat_Postscript_line(k) for k in \
+                           ↪ list_letter[1:-1]]
    return dict
```

6.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

6.2.1 With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

6.2.2 With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programmation on the following model.

```
#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in piton, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}

def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-lines` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
```

```

u=0
v=1
for i in range(n-1):
    w = u+v
    u = v
    v = w
return v
#<Exercise 1>

```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

6.3 Highlighting some identifiers

The command `\SetPitonIdentifier` allows to change the formatting of some identifiers.

That command takes in three arguments:

- The optional argument (within square brackets) specifies the informatic language. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the informatic languages of `piton`.²²
- The first mandatory argument is a comma-separated list of names of identifiers.
- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf 4.2 p. 7).

Caution: Only the identifiers may be concerned by that key. The keywords and the built-in functions won’t be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```

\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}

def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)

```

²²We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

By using the command `\SetPitonIdentifier`, it's possible to add other built-in functions (or other new keywords, etc.) that will be detected by piton.

```
\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
```

6.4 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between \$ in the comments composed in LaTeX mathematical mode.
- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the key `detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `{Piton}` many commands and environments of Beamer: cf. 6.5 p. 18.

6.4.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It's possible to change the formatting of the LaTeX comment itself by changing the piton style `Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part 8.2 p. 23

If the user has required line numbers (with the key `line-numbers`), it's possible to refer to a number of line with the command `\label` used in a LaTeX comment.²³

6.4.2 The key “math-comments”

It's possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, which is available only in the preamble of the document.

Here is a example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}

def square(x):
    return x*x # compute  $x^2$ 
```

6.4.3 The key “detected-commands”

The key `detected-commands` of `\PitonOptions` allows to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).
- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must appear explicitly in the informatic listing).

We assume that the preamble of the LaTeX document contains the following line.

```
\PitonOptions{detected-commands = highLight}
```

Then, it's possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highLight{return n*fact(n-1)}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

²³That feature is implemented by using a redefinition of the standard command `\label` in the environments `{Piton}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

6.4.4 The mechanism “escape”

It's also possible to overwrite the Python listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it's necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, *available only in the preamble of the document*.

We consider once again the previous example of a recursive programmation of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `luatex`, we can use the syntax `\highLight[LightPink]{...}`. Because of the optional argument between square brackets, it's not possible to use the key `detected-commands` but it's possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape!=!,end-escape!=!}
```

Then, it's possible to write:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight[LightPink]{!return n*fact(n-1)!}!
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

Caution : The escape to LaTeX allowed by the `begin-escape` and `end-escape` is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with `#>`; such comments are merely called “LaTeX comments” in this document).

6.4.5 The mechanism “escape-math”

The mechanism “`escape-math`” is very similar to the mechanism “`escape`” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “`escape-math`” is in fact rather different from that of the mechanism “`escape`”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and therefore, they can't be used to change the formatting of other lexical units.

In the languages where the character `$` does not play a important role, it's possible to activate that mechanism “`escape-math`” with the character `$`:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Remark that the character `$` must *not* be protected by a backslash.

However, it's probably more prudent to use `\(`` et `\)``.

```
\PitonOptions{begin-escape-math=\(`,end-escape-math=\)`}
```

Here is an example of utilisation.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \x < 0\ :
        return \(-\arctan(-x)\)
    elif \x > 1\ :
        return \(\pi/2 - \arctan(1/x)\)
    else:
        s = \0\
        for \k\ in range(\n\): s += \smash{\frac{(-1)^k}{2k+1} x^{2k+1}}\
    return s
\end{Piton}
```

```
1 def arctan(x,n=10):
2     if x < 0 :
3         return - arctan(-x)
4     elif x > 1 :
5         return pi/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s += (-1)^k / (2k+1) * x^(2k+1)
9         return s
```

6.5 Behaviour in the class Beamer

First remark

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.²⁴

When the package `piton` is used within the class `beamer`²⁵, the behaviour of `piton` is slightly modified, as described now.

6.5.1 {Piton} et \PitonInputFile are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

6.5.2 Commands of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

²⁴Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

²⁵The extension `piton` detects the class `beamer` and the package `beamerarticle` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

- no mandatory argument : `\pause26`. ;
 - one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ;
- New 3.1**
- It's possible to add new commands to that list with the key `detected-beamer-commands` (the names of the commands must *not* be preceded by a backslash).
- two mandatory arguments : `\alt` ;
 - three mandatory arguments : `\temporal`.

These commands must be used preceded and following by a space. In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings²⁷ of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}
```

In the previous example, the braces in the Python strings "`{`" and "`}`" are correctly interpreted (without any escape character).

6.5.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following environments of Beamer are directly detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`): `{actionenv}`, `{alertenv}`, `{invisibleref}`, `{onlyenv}`, `{uncoverenv}` and `{visibleenv}`.

New 3.1

It's possible to add new environments to that list with the key `detected-beamer-environments`.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body. The instructions `\begin{...}` and `\end{...}` must be alone on their lines.

Here is an example:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""

```

²⁶One should remark that it's also possible to use the command `\pause` in a “LaTeX comment”, that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

²⁷The short strings of Python are the strings delimited by characters '`'` or the characters "`"` and not '`'''` nor '`"""`'. In Python, the short strings can't extend on several lines.

```

\begin{uncoverenv}<2>
return x*x
\end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}

```

Remark concerning the command `\alert` and the environment `{alertyenv}` of Beamer

Beamer provides an easy way to change the color used by the environment `{alertyenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertyenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `luatex` (that extension requires also the package `luacolor`).

```

\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
  {\renewenvironment<>{alertyenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother

```

That code redefines locally the environment `{alertyenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertyenv}`).

6.6 Footnotes in the environments of piton

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferably. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

Important remark : If you use Beamer, you should know that Beamer has its own system to extract the footnotes. Therefore, `piton` must be loaded in that class without the option `footnote` nor the option `footnotehyper`.

By default, in an environment `{Piton}`, a command `\footnote` may appear only within a “LaTeX comment”. But it's also possible to add the command `\footnote` to the list of the “*detected-commands*” (cf. part 6.4.3, p. 16).

In this document, the package `piton` has been loaded with the option `footnotehyper` and we added the command `\footnote` to the list of the “*detected-commands*” with the following instruction in the preamble of the LaTeX document.

```
\PitonOptions{detected-commands = footnote}
```

```
\PitonOptions{background-color=gray!10}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)28
    elif x > 1:
        return pi/2 - arctan(1/x)29
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can't be broken by a page break.

```
\PitonOptions{background-color=gray!10}
\emph{\begin{minipage}{\linewidth}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)a
    elif x > 1:
        return pi/2 - arctan(1/x)b
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

^aFirst recursive call.

^bSecond recursive call.

6.7 Tabulations

Even though it's recommended to indent the Python listings with spaces (see PEP 8), `piton` accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by n spaces. The initial value of n is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value n of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and

²⁸First recursive call.

²⁹Second recursive call.

applies `gobble` with that value of n (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces). The key `env-gobble` is not compatible with the tabulations.

7 API for the developpers

The L3 variable `\l_piton_language_str` contains the name of the current language of `piton` (in lower case).

New 2.6

The extension `piton` provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of `piton`.

- The carriage returns (which are present in the initial environment) appears as characters `\r` (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 4).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` (cf. part 6.4.3) and the elements inserted by the mechanism “`escape`” (cf. part 6.4.4).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 8.4, p. 24.

8 Examples

8.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the Python listings by using the key `line-numbers` (used without value).

By default, the numbers of the lines are composed by `piton` in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!10, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

8.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with #>) aligned on the right margin.

```
\PitonOptions{background-color=gray!10}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)      another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`. Several compilations are required.

```
\PitonOptions{background-color=gray!10, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)      another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

8.3 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 7.

We present now an example of tuning of these styles adapted to the documents in black and white.

We use the font *DejaVu Sans Mono*³⁰ specified by the command \setmonofont of fontspec.

That tuning uses the command \highLight of luatex (that package requires itself the package luacolor).

```
\setmonofont[Scale=0.85]{DejaVu Sans Mono}

\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
    Comment.LaTeX = \normalfont \color{gray},
    Keyword = \bfseries ,
    Name.Namespace = ,
    Name.Class = ,
    Name.Type = ,
    InitialValues = \color{gray}
}
```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formatting instruction (the element will be composed in the standard color, usually in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in piton is *not* empty.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) = π/2 for x > 0)
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
        return s
```

8.4 Use with pyluatex

The package pyluatex is an extension which allows the execution of some Python code from lualatex (provided that Python is installed on the machine and that the compilation is done with lualatex and --shell-escape).

Here is, for example, an environment {PitonExecute} which formats a Python listing (with piton) but also displays the output of the execution of the code with Python.

³⁰See: <https://dejavu-fonts.github.io>

```
\NewPitonEnvironment{PitonExecute}{!O{}}
{\PitonOptions{#1}}
{\begin{center}
\directlua{pyluatex.execute(piton.get_last_code(), false, true, false, true)}%
\end{center}}
\noignorespacesafterend}
```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 7, p. 22.

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

9 The styles for the different computer languages

9.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.³¹

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the short strings (entre ' ou ")
<code>String.Long</code>	the long strings (entre ''' ou """)) excepted the doc-strings (governed by <code>String.Doc</code>)
<code>String</code>	that key fixes both <code>String.Short</code> et <code>String.Long</code>
<code>String.Doc</code>	the doc-strings (only with """ following PEP 257)
<code>String.Interpol</code>	the syntactic elements of the fields of the f-strings (that is to say the characters { et }); that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
<code>Interpol.Inside</code>	the content of the interpolations in the f-strings (that is to say the elements between { and }); if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Operator</code>	the following operators: != == << >> - ~ + / * % = < > & . @
<code>Operator.Word</code>	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
<code>Name.Builtin</code>	almost all the functions predefined by Python
<code>Name.Decorator</code>	the decorators (instructions beginning by @)
<code>Name.Namespace</code>	the name of the modules
<code>Name.Class</code>	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code>)
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code>)
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and, hence, these elements are drawn, by default, in the current color, usually black)
<code>Exception</code>	les exceptions pré définies (ex.: <code>SyntaxError</code>)
<code>InitialValues</code>	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Comment</code>	the comments beginning with #
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
<code>Keyword.Constant</code>	<code>True</code> , <code>False</code> et <code>None</code>
<code>Keyword</code>	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>in</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .

³¹See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color #F0F3F3. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

9.2 The language OCaml

It's possible to switch to the language OCaml with \PitonOptions{language = OCaml}.

It's also possible to set the language OCaml for an individual environment {Piton}.

```
\begin{Piton}[language=OCaml]
...
\end{Piton}
```

The option exists also for \PitonInputFile : \PitonInputFile[language=OCaml]{...}

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both String.Short and String.Long
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : and, asr, land, lor, lsl, lxor, mod et or
Name.Builtin	les fonctions not, incr, decr, fst et snd
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the OCaml functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Exception	the predefined exceptions (eg : End_of_File)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	true et false
Keyword	the following keywords: assert, as, begin, class, constraint, done, downto, do, else, end, exception, external, for, function, functor, fun , if include, inherit, initializer, in , lazy, let, match, method, module, mutable, new, object, of, open, private, raise, rec, sig, struct, then, to, try, type, value, val, virtual, when, while and with

9.3 The language C (and C++)

It's possible to switch to the language C with `\PitonOptions{language = C}`.

It's also possible to set the language C for an individual environment `{Piton}`.

```
\begin{Piton}[language=C]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=C]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & . @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while

9.4 The language SQL

It's possible to switch to the language SQL with `\PitonOptions{language = SQL}`.

It's also possible to set the language SQL for an individual environment `{Piton}`.

```
\begin{Piton}[language=SQL]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=SQL]{...}`

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code>)
<code>Operator</code>	the following operators : = != <> >= > < <= * + /
<code>Name.Table</code>	the names of the tables
<code>Name.Field</code>	the names of the fields of the tables
<code>Name.Builtin</code>	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
<code>Comment</code>	the comments (beginning by -- or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by --> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the following keywords (their names are <i>not</i> case-sensitive): add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when and with.

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

9.5 The language “minimal”

It's possible to switch to the language “minimal” with `\PitonOptions{language = minimal}`.

It's also possible to set the language “minimal” for an individual environment `{Piton}`.

```
\begin{Piton}[language=minimal]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=minimal]{...}`

Style	Usage
<code>Number</code>	the numbers
<code>String</code>	the strings (between ")
<code>Comment</code>	the comments (which begin with #)
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 6.3, p. 14) in order to create, for example, a language for pseudo-code.

9.6 The languages defined by \NewPitonLanguage

The command `\NewPitonLanguage`, which defines new informatic languages with the syntax of the extension `listings`, has been described p. 9.

All the languages defined by the command `\NewPitonLanguage` use the same styles.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings defined in <code>\NewPitonLanguage</code> by the key <code>morestring</code>
<code>Comment</code>	the comments defined in <code>\NewPitonLanguage</code> by the key <code>morecomment</code>
<code>Comment.LaTeX</code>	the comments which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the keywords defined in <code>\NewPitonLanguage</code> by the keys <code>morekeywords</code> and <code>moretexcs</code> (and also the key <code>sensitive</code> which specifies whether the keywords are case-sensitive or not)
<code>Directive</code>	the directives defined in <code>\NewPitonLanguage</code> by the key <code>moredirectives</code>
<code>Tag</code>	the “tags” defined by the key <code>tag</code> (the lexical units detected within the tag will also be formatted with their own style)

10 Implementation

The development of the extension `piton` is done on the following GitHub depot:
<https://github.com/fpantigny/piton>

10.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code with *interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.³²

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the `lpeg python` against that code is the Lua table containing the following elements :

```
{ "\\\_piton_begin_line:" }a
{ "{\PitonStyle{Keyword}{}}"b
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Name.Function}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, "(" }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ luatexbase.catcodetables.CatcodeTableOther, ")" }
{ luatexbase.catcodetables.CatcodeTableOther, ":" }
{ "\\\_piton_end_line: \\\_piton_newline: \\\_piton_begin_line:" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Keyword}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "return" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ "{\PitonStyle{Operator}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "&" }
{ "}" }
{ "{\PitonStyle{Number}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "2" }
{ "}" }
{ "\\\_piton_end_line:" }
```

^aEach line of the Python listings will be encapsulated in a pair: `_@@_begin_line: - \@@_end_line:`. The token `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`. Both tokens `_@@_begin_line:` and `\@@_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

^bThe lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

^c`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

³²Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character \r will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by \ExplSyntaxOn)

```
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{def}}
\_\_piton\_end\_line:{\PitonStyle{Name.Function}{parity}}(x):\_\_piton\_newline:
\_\_piton\_begin\_line:\_\_piton\_newline{\PitonStyle{Keyword}{return}}
\_\_piton\_end\_line:{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}\_\_piton\_newline:
```

10.2 The L3 part of the implementation

10.2.1 Declaration of the package

```
1 (*STY)
2 \NeedsTeXFormat{LaTeX2e}
3 \RequirePackage{l3keys2e}
4 \ProvidesExplPackage
5   {piton}
6   {\PitonFileVersion}
7   {\PitonFileDate}
8   {Highlight informatic listings with LPEG on LuaLaTeX}
```

21   \msg_redirect_name:nnn { piton } { #1 } { none }
22   \group_end:
23 }
```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That’s why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
24 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
25 {
26   \bool_if:NTF \g_@@_messages_for_Overleaf_bool
27     { \msg_new:nnn { piton } { #1 } { #2 \\ #3 } }
28     { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
29 }
```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by currying.

```
30 \cs_new_protected:Npn \@@_error_or_warning:n
31   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always “output”.

```

135     + "\\"only" + "\\"visible" + "\\"invisible" + "\\"alert" + "\\"action"
136   piton.beamer_environments = { "uncoverenv" , "onlyenv" , "visibleenv" ,
137     "invisibleref" , "alertenv" , "actionenv" }
138   piton.DetectedCommands = lpeg.P ( false )
139   piton.last_code = ''
140   piton.last_language = ''
141 }
```

10.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

142 \str_new:N \l_piton_language_str
143 \str_set:Nn \l_piton_language_str { python }
```

Each time the command `\PitonInputFile` of `piton` is used, the code of that environment will be stored in the following global string.

```
144 \tl_new:N \g_piton_last_code_tl
```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```
145 \seq_new:N \l_@@_path_seq
```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```
146 \str_new:N \l_@@_path_write_str
```

In order to have a better control over the keys.

```

147 \bool_new:N \l_@@_in_PitonOptions_bool
148 \bool_new:N \l_@@_in_PitonInputFile_bool
```

We will compute (with Lua) the numbers of lines of the listings (or *chunks* of listings when `split-on-empty-lines` is in force) and store it in the following counter.

```
149 \int_new:N \l_@@_nb_lines_int
```

The same for the number of non-empty lines of the listings.

```
150 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will take into account all the lines, empty or not empty. It won't be used to print the numbers of the lines but will be used to allow or disallow line breaks (when `splittable` is in force) and for the color of the background (when `background-color` is used with a *list* of colors).

```
151 \int_new:N \g_@@_line_int
```

The following token list will contain the (potential) information to write on the `aux` (to be used in the next compilation). The technic of the auxiliary file will be used when the key `width` is used with the value `min`.

```
152 \tl_new:N \g_@@_aux_tl
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to *n*, then no line break can occur within the first *n* lines or the last *n* lines of a listing (or a *chunk* of listings when the key `split-on-empty-lines` is in force).

```
153 \int_new:N \l_@@_splittable_int
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
154 \int_set:Nn \l_@@splittable_int { 100 }
```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the informatic code provided by the final user is split in chunks on the empty lines in the code).

```
155 \tl_new:N \l_@@split_separation_tl
156 \tl_set:Nn \l_@@split_separation_tl
157 { \vspace{ \baselineskip } \vspace{ -1.25pt } }
```

That parameter must contain elements to be inserted in *vertical* mode by TeX.

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
158 \clist_new:N \l_@@bg_color_clist
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
159 \tl_new:N \l_@@prompt_bg_color_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
160 \str_new:N \l_@@begin_range_str
161 \str_new:N \l_@@end_range_str
```

The argument of `\PitonInputFile`.

```
162 \str_new:N \l_@@file_name_str
```

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@env_int`).

```
163 \int_new:N \g_@@env_int
```

The parameter `\l_@@writer_str` corresponds to the key `write`. We will store the list of the files already used in `\g_@@write_seq` (we must not erase a file which has been still been used).

```
164 \str_new:N \l_@@write_str
165 \seq_new:N \g_@@write_seq
```

The following boolean corresponds to the key `show-spaces`.

```
166 \bool_new:N \l_@@show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
167 \bool_new:N \l_@@break_lines_in_Piton_bool
168 \bool_new:N \l_@@indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
169 \tl_new:N \l_@@continuation_symbol_tl
170 \tl_set:Nn \l_@@continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
171 \tl_new:N \l_@@csoi_tl
172 \tl_set:Nn \l_@@csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
173 \tl_new:N \l_@@end_of_broken_line_tl
174 \tl_set:Nn \l_@@end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
175 \bool_new:N \l_@@break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the aux file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_line_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

176 `\dim_new:N \l_@@_width_dim`

We will also use another dimension called `\l_@@_line_width_dim`. That will the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

177 `\dim_new:N \l_@@_line_width_dim`

The following flag will be raised with the key `width` is used with the special value `min`.

178 `\bool_new:N \l_@@_width_min_bool`

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `{Piton}` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the special value `min`. We need a global variable because, when the key `footnote` is in force, each line when be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

179 `\dim_new:N \g_@@_tmp_width_dim`

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

180 `\dim_new:N \l_@@_left_margin_dim`

The following boolean will be set when the key `left-margin=auto` is used.

181 `\bool_new:N \l_@@_left_margin_auto_bool`

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

182 `\dim_new:N \l_@@_numbers_sep_dim`

183 `\dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }`

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

184 `\seq_new:N \g_@@_languages_seq`

185 `\int_new:N \l_@@_tab_size_int`

186 `\int_set:Nn \l_@@_tab_size_int { 4 }`

187 `\cs_new_protected:Npn \@@_tab:`

188 `{`

189 `\bool_if:NTF \l_@@_show_spaces_bool`

190 `{`

191 `\hbox_set:Nn \l_tmpa_box`

192 `{ \prg_replicate:nn \l_@@_tab_size_int { ~ } }`

193 `\dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }`

194 `\(\mathcolor{gray}{\l_tmpa_dim}`

195 `{ \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } }`

196 `}`

197 `{ \hbox:n { \prg_replicate:nn \l_@@_tab_size_int { ~ } }`

198 `\int_gadd:Nn \g_@@_indentation_int \l_@@_tab_size_int`

199 `}`

The following integer corresponds to the key `gobble`.

```
200 \int_new:N \l_@@_gobble_int
```

The following token list will be used only for the spaces in the strings.

```
201 \tl_new:N \l_@@_space_tl
202 \tl_set_eq:NN \l_@@_space_tl \nobreakspace
```

At each line, the following counter will count the spaces at the beginning.

```
203 \int_new:N \g_@@_indentation_int
```

```
204 \cs_new_protected:Npn \@@_an_indentation_space:
205   { \int_gincr:N \g_@@_indentation_int }
```

The following command `\@@_beamer_command:n` executes the argument corresponding to its argument but also stores it in `\l_@@_beamer_command_str`. That string is used only in the error message “`cr~not~allowed`” raised when there is a carriage return in the mandatory argument of that command.

```
206 \cs_new_protected:Npn \@@_beamer_command:n #1
207   {
208     \str_set:Nn \l_@@_beamer_command_str { #1 }
209     \use:c { #1 }
210   }
```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```
211 \cs_new_protected:Npn \@@_label:n #1
212   {
213     \bool_if:NTF \l_@@_line_numbers_bool
214       {
215         \bphack
216         \protected@write \auxout { }
217         {
218           \string \newlabel { #1 }
219         }
220       }
```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```
220   { \int_eval:n { \g_@@_visual_line_int + 1 } }
221   { \thepage }
222   }
223   }
224   \esphack
225 }
226 { \@@_error:n { label-with-lines-numbers } }
```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “`range`” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

```
228 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
229 \cs_new_protected:Npn \@@_marker_end:n #1 { }
```

The following commands are a easy way to insert safely braces (`{` and `}`) in the TeX flow.

```
230 \cs_new_protected:Npn \@@_open_brace: { \lua_now:n { piton.open_brace() } }
231 \cs_new_protected:Npn \@@_close_brace: { \lua_now:n { piton.close_brace() } }
```

The following token list will be evaluated at the beginning of `\@@_begin_line:...` `\@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
232 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```

233 \cs_new_protected:Npn \@@_prompt:
234 {
235     \tl_gset:Nn \g_@@_begin_line_hook_tl
236     {
237         \tl_if_empty:NF \l_@@_prompt_bg_color_tl
238             { \clist_set:NV \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
239     }
240 }
```

10.2.3 Treatment of a line of code

The following command is only used once. We have written an autonomous function only for legibility.

```

241 \cs_new_protected:Npn \@@_replace_spaces:n #1
242 {
243     \tl_set:Nn \l_tmpa_tl { #1 }
244     \bool_if:NTF \l_@@_show_spaces_bool
245     {
246         \tl_set:Nn \l_@@_space_tl { \u{20} }
247         \regex_replace_all:nnN { \x20 } { \u{20} } \l_tmpa_tl % U+2423
248     }
249 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:`. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```

250     \bool_if:NT \l_@@_break_lines_in_Piton_bool
251     {
252         \regex_replace_all:nnN
253             { \x20 }
254             { \c{@@_breakable_space}: } }
255         \l_tmpa_tl
256     }
257 }
258 \l_tmpa_tl
259 }
```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`. `\@@_begin_line:` is a LaTeX command that we will define now but `\@@_end_line:` is only a syntactic marker that has no definition.

```

260 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
261 {
262     \group_begin:
263     \g_@@_begin_line_hook_tl
264     \int_gzero:N \g_@@_indentation_int
```

First, we will put in the coffin `\l_tmpa_coffin` the actual content of a line of the code (without the potential number of line).

Be careful: There is curryfication in the following code.

```

265     \bool_if:NTF \l_@@_width_min_bool
266         \@@_put_in_coffin_i:i:n
267         \@@_put_in_coffin_i:i:n
268     {
269         \language = -1
270         \raggedright
271         \strut
272         \@@_replace_spaces:n { #1 }
```

```

273           \strut \hfil
274       }
275   \hbox_set:Nn \l_tmpa_box
276   {
277     \skip_horizontal:N \l_@@_left_margin_dim
278     \bool_if:NT \l_@@_line_numbers_bool
279     {
280       \bool_if:nF
281       {
282         \str_if_eq_p:nn { #1 } { \PitonStyle { Prompt } { } }
283         &&
284         \l_@@_skip_empty_lines_bool
285       }
286       { \int_gincr:N \g_@@_visual_line_int }
287     \bool_if:nT
288     {
289       ! \str_if_eq_p:nn { #1 } { \PitonStyle { Prompt } { } }
290       ||
291       ( ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool )
292     }
293     \@@_print_number:
294   }

```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```

295   \clist_if_empty:NF \l_@@_bg_color_clist
296   {
297     ... but if only if the key left-margin is not used !
298     \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
299     { \skip_horizontal:n { 0.5 em } }
300   }
301   \coffin_typeset:Nnnnn \l_tmpa_coffin T 1 \c_zero_dim \c_zero_dim
302   \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + 1.25 pt }
303   \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + 1.25 pt }
304   \clist_if_empty:NTF \l_@@_bg_color_clist
305   { \box_use_drop:N \l_tmpa_box }
306   {
307     \vtop
308     {
309       \hbox:n
310       {
311         \@@_color:N \l_@@_bg_color_clist
312         \vrule height \box_ht:N \l_tmpa_box
313             depth \box_dp:N \l_tmpa_box
314             width \l_@@_width_dim
315       }
316       \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
317       \box_use_drop:N \l_tmpa_box
318     }
319   }
320   \vspace { - 2.5 pt }
321   \group_end:
322   \tl_gclear:N \g_@@_begin_line_hook_tl
323 }

```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contains several lines when the key `broken-lines-in-Piton` (or `broken-lines`) is used.

That commands takes in its argument by curryfication.

```
324 \cs_set_protected:Npn \@@_put_in_coffin_i:n
```

```
325 { \vcoffin_set:Nnn \l_tmpa_coffin \l_@@_line_width_dim }
```

The second case is the case when the key `width` is used with the special value `min`.

```
326 \cs_set_protected:Npn \@@_put_in_coffin_i:n #1
327 {
```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the `aux` file in the variable `\l_@@_width_dim`).

```
328 \hbox_set:Nn \l_tmpa_box { #1 }
```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the `aux` file the natural width of the environment).

```
329 \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
330 { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
331 \hcoffin_set:Nn \l_tmpa_coffin
332 {
333 \hbox_to_wd:nn \l_@@_line_width_dim
```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 8.2, p. 23).

```
334 { \hbox_unpack:N \l_tmpa_box \hfil }
335 }
336 }
```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```
337 \cs_set_protected:Npn \@@_color:N #1
338 {
339 \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
340 \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
341 \tl_set:Nx \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
342 \tl_if_eq:NnTF \l_tmpa_tl { none }
```

By setting `\l_@@_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```
343 { \dim_zero:N \l_@@_width_dim }
344 { \exp_args:NV \@@_color_i:n \l_tmpa_tl }
345 }
```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```
346 \cs_set_protected:Npn \@@_color_i:n #1
347 {
348 \tl_if_head_eq_meaning:nNTF { #1 } [
349 {
350 \tl_set:Nn \l_tmpa_tl { #1 }
351 \tl_set_rescan:Nno \l_tmpa_tl { } \l_tmpa_tl
352 \exp_last_unbraced:No \color \l_tmpa_tl
353 }
354 { \color { #1 } }
355 }
```

The command `\@@_newline:` will be inserted by Lua between two lines of the informatic listing.

- In fact, it will be inserted between two commands `\@@_begin_line:... \@@_end_of_line:..`
- When the key `break-lines-in-Piton` is in force, a line of the informatic code (the *input*) may result in several lines in the PDF (the *output*).
- `\@@_newline:` has a rather complex behaviour because it may close and open `\vtops` and finish and start paragraphs.

```

356 \cs_new_protected:Npn @@_newline:
357 {

```

We recall that `\g_@@_line_int` is *not* used for the number of line printed in the PDF (when `line-numbers` is in force)...

```

358     \int_gincr:N \g_@@_line_int

```

... it will be used to allow or disallow page breaks (the final user controls that behaviour with the key `splittable`).

```

359     \int_compare:nNnT \g_@@_line_int > { \l_@@_splittable_int - 1 }
360     {
361         \int_compare:nNnT
362         { \l_@@_nb_lines_int - \g_@@_line_int + 1 } > \l_@@_splittable_int

```

Now, we allow a page break after the current line of code.

```

363     {
364         \egroup
365         \bool_if:NT \g_@@_footnote_bool \endsavenotes
366         \par

```

Each non-splittable block of lines is composed in a `\vtop` of TeX inserted in a paragraph of TeX.

- In the previous lines, we have closed a `\vtop` (with `\egroup`) and a paragraph (with `\par`).
- Now, we start a new paragraph (with `\mode_leave_vertical:`) and open a `\vtop` (with `\vtop \bgroup`).

```

367     \mode_leave_vertical:
368     \bool_if:NT \g_@@_footnote_bool \savenotes
369     \vtop \bgroup

```

And, in that `\vtop`, of course, we will put a box for each line of the informatic listing (but a line of the informatic listing may be formatted as a box of several lines when `break-lines-in-Piton` is in force).

```

370     }
371     }
372 }

```

After the command `\@@_newline:`, we will have a command `\@@_begin_line::`.

```

654   \keys_set:nn { PitonOptions } { #1 }
655   \bool_set_false:N \l_@@_in_PitonOptions_bool
656 }

```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different than in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

657 \NewDocumentCommand \@@_fake_PitonOptions { }
658 { \keys_set:nn { PitonOptions } }

```

10.2.5 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`) whereas the counter `\g_@@_line_int` previously defined is *not* used for that functionality.

```

659 \int_new:N \g_@@_visual_line_int
660 \cs_new_protected:Npn \@@_incr_visual_line:
661 {
662   \bool_if:NF \l_@@_skip_empty_lines_bool
663   { \int_gincr:N \g_@@_visual_line_int }
664 }

665 \cs_new_protected:Npn \@@_print_number:
666 {
667   \hbox_overlap_left:n
668   {
669   {
670     \l_@@_line_numbers_format_tl

```

We put braces. Thus, the user may use the key `line-numbers/format` with a value such as `\fbox`.

```

671   { \int_to_arabic:n \g_@@_visual_line_int }
672   }
673   \skip_horizontal:N \l_@@_numbers_sep_dim
674 }
675 }

```

10.2.6 The command to write on the aux file

```

676 \cs_new_protected:Npn \@@_write_aux:
677 {
678     \tl_if_empty:NF \g_@@_aux_tl
679     {
680         \iow_now:Nn \mainaux { \ExplSyntaxOn }
681         \iow_now:Nx \mainaux
682         {
683             \tl_gset:cn { c_@@_int_use:N \g_@@_env_int _ tl }
684             { \exp_not:o \g_@@_aux_tl }
685         }
686         \iow_now:Nn \mainaux { \ExplSyntaxOff }
687     }
688     \tl_gclear:N \g_@@_aux_tl
689 }
```

The following macro will be used only when the key `width` is used with the special value `min`.

```

690 \cs_new_protected:Npn \@@_width_to_aux:
691 {
692     \tl_gput_right:Nx \g_@@_aux_tl
693     {
694         \dim_set:Nn \l_@@_line_width_dim
695         { \dim_eval:n { \g_@@_tmp_width_dim } }
696     }
697 }
```

10.2.7 The main commands and environments for the final user

```

698 \NewDocumentCommand { \NewPitonLanguage } { O{ } m ! o }
699 {
700     \tl_if_novalue:nTF { #3 }
```

The last argument is provided by currying.

```
701     { \@@_NewPitonLanguage:nnn { #1 } { #2 } }
```

The two last arguments are provided by currying.

```
702     { \@@_NewPitonLanguage:nnnn { #1 } { #2 } { #3 } }
703 }
```

The following property list will contain the definitions of the informatic languages as provided by the final user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```

704 \prop_new:N \g_@@_languages_prop

705 \keys_define:nn { NewPitonLanguage }
706 {
707     morekeywords .code:n = ,
708     otherkeywords .code:n = ,
709     sensitive .code:n = ,
710     keywordsprefix .code:n = ,
711     moretexcs .code:n = ,
712     morestring .code:n = ,
713     morecomment .code:n = ,
714     moredelim .code:n = ,
715     moredirectives .code:n = ,
716     tag .code:n = ,
717     alsodigit .code:n = ,
718     alsoletter .code:n = ,
719     alsoother .code:n = ,
720     unknown .code:n = \@@_error:n { Unknown-key~NewPitonLanguage }
721 }
```

The function `\@@_NewPitonLanguage:nnn` will be used when the language is *not* defined above a base language (and a base dialect).

```
722 \cs_new_protected:Npn \@@_NewPitonLanguage:nnn #1 #2 #3
723 {
```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have written `\NewPitonLanguage[]{Java}{...}`.

```
724 \tl_set:Nx \l_tmpa_tl
725 {
726     \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
727     \str_lowercase:n { #2 }
728 }
```

The following set of keys is only used to raise an error when a key is unknown!

```
729 \keys_set:nn { NewPitonLanguage } { #3 }
```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```
730 \prop_gput:Non \g_@@_languages_prop \l_tmpa_tl { #3 }
```

The Lua part of the package `piton` will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the utilisation of the Lua function `piton.new_language` (which does the main job).

```
731 \exp_args:NV \@@_NewPitonLanguage:nn \l_tmpa_tl { #3 }
732 }
733 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
734 {
735     \hook_gput_code:nnn { begindocument } { . }
736     { \lua_now:e { piton.new_language("#1", "\lua_escape:n{#2}") } }
737 }
```

Now the case when the language is defined upon a base language.

```
738 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4 #5
739 {
```

We store in `\l_tmpa_tl` the name of the base language with the dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have used `\NewPitonLanguage[Handel]{C}[]{C}{...}`

```
740 \tl_set:Nx \l_tmpa_tl
741 {
742     \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
743     \str_lowercase:n { #4 }
744 }
```

We retrieve in `\l_tmpb_tl` the definition (as provided by the final user) of that base language. Caution: `\g_@@_languages_prop` does not contain all the languages provided by `piton` but only those defined by using `\NewPitonLanguage`.

```
745 \prop_get:NoNTF \g_@@_languages_prop \l_tmpa_tl \l_tmpb_tl
```

We can now define the new language by using the previous function.

```
746 { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_tl }
747 { \@@_error:n { Language-not-defined } }
748 }
```

```
749 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4
```

In the following line, we write `#4, #3` and not `#3, #4` because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```
750 { \@@_NewPitonLanguage:nnn { #1 } { #2 } { #4 , #3 } }
751 \cs_generate_variant:Nn \@@_NewPitonLanguage:nnnn { n n n o }
```

```
752 \NewDocumentCommand { \piton } { }
753 { \peek_meaning:NTF \bgroup \@@_piton_standard \@@_piton_verbatim }
754 \NewDocumentCommand { \@@_piton_standard } { m }
755 {
```

```
756 \group_begin:
```

The following tuning of LuaTeX in order to avoid all break of lines on the hyphens.

```
757 \automatichyphenmode = 1
```

Remark that the argument of `\piton` (with the normal syntax) is expanded in the TeX sens, (see the `\tl_set:Nx` below) and that's why we can provide the following escapes to the final user:

```
758 \cs_set_eq:NN \\ \c_backslash_str
759 \cs_set_eq:NN \% \c_percent_str
760 \cs_set_eq:NN \{ \c_left_brace_str
761 \cs_set_eq:NN \} \c_right_brace_str
762 \cs_set_eq:NN \$ \c_dollar_str
```

The standard command `_u` is *not* expandable and we need here expandable commands. With the following code, we define an expandable command.

```
763 \cs_set_eq:cN { ~ } \space
764 \cs_set_protected:Npn \@@_begin_line: { }
765 \cs_set_protected:Npn \@@_end_line: { }
766 \tl_set:Nx \l_tmpa_tl
767 {
768     \lua_now:e
769         { piton.ParseBis('l_piton_language_str',token.scan_string()) }
770         { #1 }
771     }
772 \bool_if:NTF \l_@@_show_spaces_bool
773     { \regex_replace_all:nnN { \x20 } { \_u } \l_tmpa_tl } % U+2423
```

The following code replaces the characters U+0020 (spaces) by characters U+0020 of catcode 10: thus, they become breakable by an end of line. Maybe, this programmation is not very efficient but the key `break-lines-in-piton` will be rarely used.

```
774 {
775     \bool_if:NT \l_@@_break_lines_in_piton_bool
776         { \regex_replace_all:nnN { \x20 } { \x20 } \l_tmpa_tl }
777 }
```

The command `\text` is provided by the package `amstext` (loaded by `piton`).

```
778 \if_mode_math:
779     \text { \ttfamily \l_tmpa_tl }
780 \else:
781     \ttfamily \l_tmpa_tl
782 \fi:
783 \group_end:
784 }
785 \NewDocumentCommand { \@@_piton_verbatim } { v }
786 {
787     \group_begin:
788     \ttfamily
789     \automatichyphenmode = 1
790     \cs_set_protected:Npn \@@_begin_line: { }
791     \cs_set_protected:Npn \@@_end_line: { }
792     \tl_set:Nx \l_tmpa_tl
793     {
794         \lua_now:e
795             { piton.Parse('l_piton_language_str',token.scan_string()) }
796             { #1 }
797         }
798     \bool_if:NT \l_@@_show_spaces_bool
799         { \regex_replace_all:nnN { \x20 } { \_u } \l_tmpa_tl } % U+2423
800     \l_tmpa_tl
801     \group_end:
802 }
```

The following command is not a user command. It will be used when we will have to “rescan” some chunks of Python code. For example, it will be the initial value of the Piton style `InitialValues` (the default values of the arguments of a Python function).

```

803 \cs_new_protected:Npn \@@_piton:n #1
804 {
805     \group_begin:

839     \@@_piton:n { #1 }
840     \group_end:
841 }

```

Despite its name, `\@@_pre_env:` will be used both in `\PitonInputFile` and in the environments such as `{Piton}`.

```

842 \cs_new:Npn \@@_pre_env:
843 {
844     \automatichyphenmode = 1
845     \int_gincr:N \g_@@_env_int
846     \tl_gclear:N \g_@@_aux_tl
847     \dim_compare:nNnT \l_@@_width_dim = \c_zero_dim
848         { \dim_set_eq:NN \l_@@_width_dim \linewidth }

```

We read the information written on the aux file by a previous run (when the key `width` is used with the special value `min`). At this time, the only potential information written on the aux file is the value of `\l_@@_line_width_dim` when the key `width` has been used with the special value `min`.

```

849     \cs_if_exist_use:c { c_@@_ \int_use:N \g_@@_env_int _ tl }
850     \bool_if:NF \l_@@_resume_bool { \int_gzero:N \g_@@_visual_line_int }
851     \dim_gzero:N \g_@@_tmp_width_dim
852     \int_gzero:N \g_@@_line_int
853     \dim_zero:N \parindent
854     \dim_zero:N \lineskip
855     \cs_set_eq:NN \label \@@_label:n

```

```
856 }
```

If the final user has used both `left-margin=auto` and `line-numbers`, we have to compute the width of the maximal number of lines at the end of the environment to fix the correct value to `left-margin`. The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```
857 \cs_new_protected:Npn \@@_compute_left_margin:nn #1 #2
858 {
859     \bool_lazy_and:nnT \l_@@_left_margin_auto_bool \l_@@_line_numbers_bool
860     {
861         \hbox_set:Nn \l_tmpa_box
862         {
863             \l_@@_line_numbers_format_tl
864             \bool_if:NTF \l_@@_skip_empty_lines_bool
865             {
866                 \lua_now:n
867                 { \piton.#1(token.scan_argument()) }
868                 { #2 }
869                 \int_to_arabic:n
870                 { \g_@@_visual_line_int + \l_@@_nb_non_empty_lines_int }
871             }
872             {
873                 \int_to_arabic:n
874                 { \g_@@_visual_line_int + \l_@@_nb_lines_int }
875             }
876         }
877         \dim_set:Nn \l_@@_left_margin_dim
878         { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
879     }
880 }
881 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }
```

Whereas `\l_@@_width_dim` is the width of the environment, `\l_@@_line_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute `\l_@@_line_width_dim` from `\l_@@_width_dim` or we have to do the opposite.

```
882 \cs_new_protected:Npn \@@_compute_width:
883 {
884     \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
885     {
886         \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
887         \clist_if_empty:NTF \l_@@_bg_color_clist
```

If there is no background, we only subtract the left margin.

```
888     { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
```

If there is a background, we subtract 0.5 em for the margin on the right.

```
889     {
890         \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }
```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value³³ and we use that value. Elsewhere, we use a value of 0.5 em.

```
891     \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
892     { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
893     { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
894 }
895 }
```

³³If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

If `\l_@@_line_width_dim` has yet a non-zero value, that means that it has been read in the `aux` file: it has been written by a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```

986   {
987     \dim_set_eq:NN \l_@@_width_dim \l_@@_line_width_dim
988     \clist_if_empty:NTF \l_@@_bg_color_clist

992         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
993           { \dim_add:Nn \l_@@_width_dim { 0.5 em } }
994           { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
995       }
996     }
997   }
998
999 \NewDocumentCommand { \NewPitonEnvironment } { m m m m }
1000 {

```

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 (“other”). The latter explains why the definition of that function is a bit complicated.

```

100 \use:x
101   {
102     \cs_set_protected:Npn
103       \use:c { _@@_collect_ #1 :w }
104       #####1
105       \c_backslash_str end \c_left_brace_str #1 \c_right_brace_str
106   }
107   {
108     \group_end:
109     \mode_if_vertical:TF { \noindent \mode_leave_vertical: } \newline

```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

100 \@@_compute_left_margin:nn { CountNonEmptyLines } { ##1 }
101 \@@_compute_width:
102 \ttfamily
103 \dim_zero:N \parskip
104 \noindent % added 2024/08/07

```

Now, the key `write`.

```

105 \str_if_empty:NTF \l_@@_path_write_str
106   { \lua_now:e { piton.write = "\l_@@_write_str" } }
107   {
108     \lua_now:e
109     { piton.write = "\l_@@_path_write_str / \l_@@_write_str" }
110   }
111 \str_if_empty:NTF \l_@@_write_str
112   { \lua_now:n { piton.write = '' } }
113   {
114     \seq_if_in:NVT \g_@@_write_seq \l_@@_write_str
115     { \lua_now:n { piton.write_mode = "a" } }
116     {
117       \lua_now:n { piton.write_mode = "w" }
118       \seq_gput_left:NV \g_@@_write_seq \l_@@_write_str
119     }
120   }

```

Now, the main job.

```

121 \bool_if:NTF \l_@@_split_on_empty_lines_bool
122   \@@_gobble_split_parse:n
123   \@@_gobble_parse:n
124   { ##1 }

```

If the user has used the key `width` with the special value `min`, we write on the `aux` file the value of `\l_@@_line_width_dim` (largest width of the lines of code of the environment).

```
945           \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:
```

The following `\end{#1}` is only for the stack of environments of LaTeX.

```
946           \end { #1 }
947           \@@_write_aux:
948       }
```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment...`

```
949   \NewDocumentEnvironment { #1 } { #2 }
950   {
951     \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
952     #3
953     \@@_pre_env:
954     \int_compare:nNnT \l_@@_number_lines_start_int > \c_zero_int
955       { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
956     \group_begin:
957     \tl_map_function:nN
958       { \ \\ \{ \} \$ \# \^ \_ \% \~ \^\I }
959     \char_set_catcode_other:N
960     \use:c { _@@_collect_ #1 :w }
961   }
962   { #4 }
```

The following code is for technical reasons. We want to change the catcode of `\^\M` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the `\^\M` is converted to space).

```
963   \AddToHook { env / #1 / begin } { \char_set_catcode_other:N \^\M }
964 }
```

This is the end of the definition of the command `\NewPitonEnvironment`.

The following function will be used when the key `split-on-empty-lines` is not in force. It will gobble the spaces at the beginning of the lines and parse the code. The argument is provided by curryfication.

```
965 \cs_new_protected:Npn \@@_gobble_parse:n
966   {
967     \lua_now:e
968     {
969       piton.GobbleParse
970       (
971         '\l_piton_language_str' ,
972         \int_use:N \l_@@_gobble_int ,
973         token.scan_argument ( )
974       )
975     }
976   }
```

The following function will be used when the key `split-on-empty-lines` is in force. It will gobble the spaces at the beginning of the lines (if the key `gobble` is in force), then split the code at the empty lines and, eventually, parse the code. The argument is provided by curryfication.

```
977 \cs_new_protected:Npn \@@_gobble_split_parse:n
978   {
979     \lua_now:e
980     {
981       piton.GobbleSplitParse
982       (
983         '\l_piton_language_str' ,
984         \int_use:N \l_@@_gobble_int ,
```

```

985         token.scan_argument ( )
986     )
987 }
988 }
```

Now, we define the environment `{Piton}`, which is the main environment provided by the package `piton`. Of course, you use `\NewPitonEnvironment`.

```

989 \bool_if:NTF \g_@@_beamer_bool
990 {
991     \NewPitonEnvironment { Piton } { d < > 0 { } }
992     {
993         \keys_set:nn { PitonOptions } { #2 }
994         \tl_if_no_value:nTF { #1 }
995         {
996             { \begin { uncoverenv } }
997             { \begin { uncoverenv } < #1 > }
998         }
999     }
1000 }
1001 {
1002     \NewPitonEnvironment { Piton } { 0 { } }
1003     { \keys_set:nn { PitonOptions } { #1 } }
1004 }
```

The code of the command `\PitonInputFile` is somewhat similar to the code of the environment `{Piton}`. In fact, it's simpler because there isn't the problem of catching the content of the environment in a verbatim mode.

```

1005 \NewDocumentCommand { \PitonInputFileTF } { d < > 0 { } m m m }
1006 {
1007     \group_begin:
```

The boolean `\l_tmap_bool` will be raised if the file is found somewhere in the path (specified by the key `path`).

```

1239     Prompt           = ,
1240     ParseAgain.noCR = \@@_piton_no_cr:n ,
1241     Discard          = \use_none:n
1242 }

```

The styles `ParseAgain.noCR` should be considered as “internal style” (not available for the final user). However, maybe we will change that and document that style for the final user.

If the key `math-comments` has been used at load-time, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document)].

```
1243 \AtBeginDocument
1244 {
1245   \bool_if:NT \g_@@_math_comments_bool
1246     { \SetPitonStyle { Comment.Math = \@@_math_scantokens:n } }
1247 }
```

10.2.10 Highlighting some identifiers

```
1248 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1249 {
1250   \clist_set:Nn \l_tmpa_clist { #2 }
1251   \tl_if_novalue:nTF { #1 }
1252   {
1253     \clist_map_inline:Nn \l_tmpa_clist
1254       { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1255   }
1256   {
1257     \str_set:Nx \l_tmpa_str { \str_lowercase:n { #1 } }
1258     \str_if_eq:onT \l_tmpa_str { current-language }
1259       { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1260     \clist_map_inline:Nn \l_tmpa_clist
1261       { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1262   }
1263 }
1264 \cs_new_protected:Npn \@@_identifier:n #1
1265 {
1266   \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1267     { \cs_if_exist_use:c { PitonIdentifier _ #1 } }
1268   { #1 }
1269 }
```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```
1270 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1271 {
```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```
1272   { \PitonStyle { Name.Function } { #1 } }
```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```
1273   \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1274     { \PitonStyle { UserFunction } }
```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```
1275   \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1276     { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1277   \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }
```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```

1278 \seq_if_in:NVF \g_@@_languages_seq \l_piton_language_str
1279   { \seq_gput_left:NV \g_@@_languages_seq \l_piton_language_str }
1280 }

1281 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1282 {
1283   \tl_if_novalue:nTF { #1 }

If the command is used without its optional argument, we will deleted the user language for all the
informatic languages.

1284   { \@@_clear_all_functions: }
1285   { \@@_clear_list_functions:n { #1 } }

```

10.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```

1526 (*LUA)
1527 if piton.comment_latex == nil then piton.comment_latex = ">" end
1528 piton.comment_latex = "#" .. piton.comment_latex
1529 local function sprintL3 ( s )
1530     tex.sprint ( luatexbase.catcodetables.expl , s )
1531 end

```

10.3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```

1532 local P , S , V , C , Ct , Cc = lpeg.P , lpeg.S , lpeg.V , lpeg.C , lpeg.Ct , lpeg.Cc
1533 local Cs , Cg , Cmt , Cb = lpeg.Cs , lpeg.Cg , lpeg.Cmt , lpeg.Cb
1534 local R = lpeg.R

```

The function `Q` takes in as argument a pattern and returns a LPEG which does a capture of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it’s suitable for elements of the Python listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```
1535 local function Q ( pattern )
1536     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1537 end
```

The function `L` takes in as argument a pattern and returns a LPEG which does a capture of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It’s suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won’t be much used.

```
1538 local function L ( pattern )
1539     return Ct ( C ( pattern ) )
1540 end
```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG with does a constant capture which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that’s the main job of `piton`). That function, unlike the previous one, will be widely used.

```
1541 local function Lc ( string )
1542     return Cc ( { luatexbase.catcodetables.expl , string } )
1543 end
```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```
1544 e
1545 local function K ( style , pattern )
1546     return
1547         Lc ( "{\\PitonStyle{" .. style .. "}" )
1548         * Q ( pattern )
1549         * Lc "}"
1550 end
```

The formatting commands in a given `piton` style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\PitonStyle{Keyword}}{text to format}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```
1551 local function WithStyle ( style , pattern )
1552     return
1553         Ct ( Cc "Open" * Cc ( "{\\PitonStyle{" .. style .. "}" ) * Cc "}" )
1554         * pattern
1555         * Ct ( Cc "Close" )
1556 end
```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```
1557 Escape = P ( false )
1558 EscapeClean = P ( false )
1559 if piton.begin_escape ~= nil
1560 then
1561     Escape =
1562         P ( piton.begin_escape )
1563         * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
1564         * P ( piton.end_escape )
```

The LPEG `EscapeClean` will be used in the LPEG Clean (and that LPEG is used to “clean” the code by removing the formatting elements).

```

1565   EscapeClean =
1566     P ( piton.begin_escape )
1567     * ( 1 - P ( piton.end_escape ) ) ^ 1
1568     * P ( piton.end_escape )
1569 end
1570 EscapeMath = P ( false )
1571 if piton.begin_escape_math ~= nil
1572 then
1573   EscapeMath =
1574     P ( piton.begin_escape_math )
1575     * Lc "\ensuremath{"
1576     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1577     * Lc ( "}" )
1578     * P ( piton.end_escape_math )
1579 end

```

The following line is mandatory.

```
1580 lpeg.locale(lpeg)
```

The basic syntactic LPEG

```

1581 local alpha , digit = lpeg.alpha , lpeg.digit
1582 local space = P " "

```

Remember that, for LPEG, the Unicode characters such as à, â, ç, etc. are in fact strings of length 2 (2 bytes) because `lpeg` is not Unicode-aware.

```

1583 local letter = alpha + "_" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
1584           + "ô" + "û" + "ü" + "Â" + "À" + "Ç" + "É" + "È" + "Ê" + "Ë"
1585           + "Ï" + "Î" + "Ô" + "Û" + "Ü"
1586
1587 local alphanum = letter + digit

```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
1588 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
1589 local Identifier = K ( 'Identifier' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function `K`. By convention, we use single quotes for delimiting the Lua strings which are names of `piton` styles (but this is only a convention).

```

1590 local Number =
1591   K ( 'Number' ,
1592     ( digit ^ 1 * P "." * # ( 1 - P "." ) * digit ^ 0
1593       + digit ^ 0 * P "." * digit ^ 1
1594       + digit ^ 1 )
1595     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
1596     + digit ^ 1
1597   )

```

We recall that `piton.begin_escape` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```

1598 local Word
1599 if piton.begin_escape then
1600   if piton.begin_escape_math then
1601     Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1602                 - piton.begin_escape_math - piton.end_escape_math
1603                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1604   else
1605     Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1606                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1607   end
1608 else
1609   if piton.begin_escape_math then
1610     Word = Q ( ( 1 - space - piton.begin_escape_math - piton.end_escape_math
1611                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1612   else
1613     Word = Q ( ( 1 - space - S "'\"\\r[({})]" - digit ) ^ 1 )
1614   end
1615 end

1616 local Space = Q " " ^ 1
1617
1618 local SkipSpace = Q " " ^ 0
1619
1620 local Punct = Q ( S ",,:;!" )
1621
1622 local Tab = "\t" * Lc "\\@@_tab:"

1623 local SpaceIndentation = Lc "\\@@_an_indentation_space:" * Q " "
1624
1624 local Delim = Q ( S "[({})]" )

```

The following LPEG catches a space (U+0020) and replace it by `\l_@@_space_t1`. It will be used in the strings. Usually, `\l_@@_space_t1` will contain a space and therefore there won't be difference. However, when the key `show-spaces-in-strings` is in force, `\\\l_@@_space_t1` will contain (U+2423) in order to visualize the spaces.

```
1625 local VisualSpace = space * Lc "\\l_@@_space_t1"
```

Several tools for the construction of the main LPEG

```

1626 local LPEG0 = { }
1627 local LPEG1 = { }
1628 local LPEG2 = { }
1629 local LPEG_cleaner = { }

```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings). The argument of `Compute_braces` must be a pattern *which does no catching*.

```

1630 local function Compute_braces ( lpeg_string ) return
1631   P { "E" ,
1632       E =
1633       (
1634         "{ " * V "E" * "}" *
1635         +
1636         lpeg_string

```

```

1637     +
1638     ( 1 - S "{}" )
1639     ) ^ 0
1640   }
1641 end

```

The following Lua function will compute the lpeg DetectedCommands which is a LPEG with captures).

```

1642 local function Compute_DetectedCommands ( lang , braces ) return
1643   Ct ( Cc "Open"
1644     * C ( piton.DetectedCommands * P "{" )
1645     * Cc "}"
1646   )
1647   * ( braces
1648     / ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end )
1649   * P "}"
1650   * Ct ( Cc "Close" )
1651 end

1652 local function Compute_LPEG_cleaner ( lang , braces ) return
1653   Ct ( ( piton.DetectedCommands * "{"
1654     * ( braces
1655       / ( function ( s )
1656         if s ~= '' then return LPEG_cleaner[lang] : match ( s ) end end )
1657       * "}"
1658     + EscapeClean
1659     + C ( P ( 1 ) )
1660   ) ^ 0 ) / table.concat
1661 end

```

Constructions for Beamer If the class Beamer is used, some environments and commands of Beamer are automatically detected in the listings of piton.

```

1662 local Beamer = P ( false )
1663 local BeamerBeginEnvironments = P ( true )
1664 local BeamerEndEnvironments = P ( true )

1665 piton.BeamerEnvironments = P ( false )
1666 for _ , x in ipairs ( piton.beamer_environments ) do
1667   piton.BeamerEnvironments = piton.BeamerEnvironments + x
1668 end

1669 BeamerBeginEnvironments =
1670   ( space ^ 0 *
1671     L
1672     (
1673       P "\begin{" * piton.BeamerEnvironments * "}"
1674       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1675     )
1676     * "\r"
1677   ) ^ 0

1678 BeamerEndEnvironments =
1679   ( space ^ 0 *
1680     L ( P "\end{" * piton.BeamerEnvironments * "}" )
1681     * "\r"
1682   ) ^ 0

```

The following Lua function will be used to compute the LPEG Beamer for each informatic language.

```
1683 local function Compute_Beamer ( lang , braces )
```

We will compute in `lpeg` the LPEG that we will return.

```

1684 local lpeg = L ( P "\\\\" pause" * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
1685 lpeg = lpeg +
1686     Ct ( Cc "Open"
1687         * C ( piton.BeamerCommands
1688             * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1689             * P "{"
1690             )
1691             * Cc "}"
1692             )
1693         * ( braces /
1694             ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1695             * "}"
1696         * Ct ( Cc "Close" )

```

For the command `\\\alt`, the specification of the overlays (between angular brackets) is mandatory.

```

1697 lpeg = lpeg +
1698     L ( P "\\\\" alt" * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1699         * ( braces /
1700             ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1701             * L ( P "}" {" )
1702             * ( braces /
1703                 ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1704             * L ( P "}" )

```

For `\\\temporal`, the specification of the overlays (between angular brackets) is mandatory.

```

1705 lpeg = lpeg +
1706     L ( ( P "\\\\" temporal" ) * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1707         * ( braces
1708             / ( function ( s )
1709                 if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1710             * L ( P "}" {" )
1711             * ( braces
1712                 / ( function ( s )
1713                     if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1714             * L ( P "}" {" )
1715             * ( braces
1716                 / ( function ( s )
1717                     if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1718             * L ( P "}" )

```

Now, the environments of Beamer.

```

1719 for _ , x in ipairs ( piton.beamer_environments ) do
1720     lpeg = lpeg +
1721         Ct ( Cc "Open"
1722             * C (
1723                 P ( "\\\\" begin{" .. x .. "}" )
1724                 * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1725             )
1726             * Cc ( "\\\\" end{" .. x .. "}" )
1727         )
1728     * (
1729         ( ( 1 - P ( "\\\\" end{" .. x .. "}" ) ) ^ 0 )
1730         / ( function ( s )
1731             if s ~= ''
1732                 then return LPEG1[lang] : match ( s )
1733             end
1734             end
1735         )
1736         * P ( "\\\\" end{" .. x .. "}" )
1737         * Ct ( Cc "Close" )
1738     end

```

Now, you can return the value we have computed.

```
1739     return lpeg
1740 end
```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```
1741 local CommentMath =
1742   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $
```

EOL The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@@_begin_line:` because you want to trigger a special background color for that row (and, after the `\@@_begin_line:`, it's too late to change de background).

```
1743 local PromptHastyDetection =
1744   ( # ( P "">>>>" + "..." ) * Lc '\@@_prompt:' ) ^ -1
```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```
1745 local Prompt = K ( 'Prompt' , ( ( P "">>>>" + "..." ) * P " " ^ -1 ) ^ -1 )
```

The following LPEG EOL is for the end of lines.

```
1746 local EOL =
1747   P "\r"
1748   *
1749   (
1750     ( space ^ 0 * -1 )
1751     +
```

We recall that each line in the Python code we have to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁴.

```
1752   Ct (
1753     Cc "EOL"
1754     *
1755     Ct (
1756       Lc "\@@_end_line:"
1757       * BeamerEndEnvironments
1758       * BeamerBeginEnvironments
1759       * PromptHastyDetection
1760       * Lc "\@@_newline: \@@_begin_line:"
1761       * Prompt
1762     )
1763   )
1764   *
1765   * ( SpaceIndentation ^ 0 * # ( 1 - S "\r" ) ) ^ -1
```

The following LPEG `CommentLaTeX` is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```
1766 local CommentLaTeX =
1767   P(piton.comment_latex)
1768   * Lc "{\PitonStyle{Comment.LaTeX}}{\ignorespaces"
1769   * L ( ( 1 - P "\r" ) ^ 0 )
1770   * Lc "}""
1771   * ( EOL + -1 )
```

³⁴Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

10.3.2 The language Python

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

1772 local Operator =
1773   K ( 'Operator' ,
1774     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "//" + "**"
1775   + S "--+/*%=<>&.@|")
1776

1826     "NotADirectoryError" + "PermissionError" + "ProcessLookupError" +
1827     "TimeoutError" + "StopAsyncIteration" + "ModuleNotFoundError" +

```

```

1828     "RecursionError" )
1829
1830
1831 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("
1832

```

In Python, a “decorator” is a statement whose begins by `@` which patches the function defined in the following statement.

```
1833 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG `DefClass` will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```

1834 local DefClass =
1835   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The following LPEG `ImportAs` is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style `Name.Namespace`.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```

1836 local ImportAs =
1837   K ( 'Keyword' , "import" )
1838   * Space
1839   * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
1840   *
1841   ( Space * K ( 'Keyword' , "as" ) * Space
1842     * K ( 'Name.Namespace' , identifier ) )
1843   +
1844   ( SkipSpace * Q "," * SkipSpace
1845     * K ( 'Name.Namespace' , identifier ) ) ^ 0
1846   )

```

Be careful: there is no commutativity of `+` in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style `Name.Namespace` and the following keyword `import` must be formatted with the piton style `Keyword` and must *not* be caught by the LPEG `ImportAs`.

Example: `from math import pi`

```

1847 local FromImport =
1848   K ( 'Keyword' , "from" )
1849   * Space * K ( 'Name.Namespace' , identifier )
1850   * Space * K ( 'Keyword' , "import" )

```

The strings of Python For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction³⁵ in that interpolation:

```
f'Total price: {total:+.2f} €'
```

The interpolations beginning by % (even though there is more modern techniques now in Python).

```
1851 local PercentInterpol =
1852   K ( 'String.Interpol' ,
1853     P "%"
1854     * ( "(" * alphanum ^ 1 * ")" ) ^ -1
1855     * ( S "-#0 +" ) ^ 0
1856     * ( digit ^ 1 + "*" ) ^ -1
1857     * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
1858     * ( S "HLL" ) ^ -1
1859     * S "sdfFeExXorgiGauc%""
1860   )
```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function K because of the interpolations which must be formatted with another piton style that the rest of the string.³⁶

```
1861 local SingleShortString =
1862   WithStyle ( 'String.Short' ,
```

First, we deal with the f-strings of Python, which are prefixed by f or F.

```
1863   Q ( P "f'" + "F'" )
1864   *
1865     K ( 'String.Interpol' , "{}" )
1866     * K ( 'Interpol.Inside' , ( 1 - S "}:;" ) ^ 0 )
1867     * Q ( P ":" * ( 1 - S "}:" ) ^ 0 ) ^ -1
1868     * K ( 'String.Interpol' , "}" )
1869     +
1870     VisualSpace
1871     +
1872     Q ( ( P "\\" + "{{" + "}}}" + 1 - S " {" ) ^ 1 )
1873   ) ^ 0
1874   * Q "''"
1875   +
```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```
1876   Q ( P "''" + "r'" + "R'" )
1877   * ( Q ( ( P "\\" + 1 - S " \r%" ) ^ 1 )
1878     + VisualSpace
1879     + PercentInterpol
1880     + Q "%"
1881   ) ^ 0
1882   * Q "''" )
```

³⁵There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say String.Short or String.Long.

³⁶The interpolations are formatted with the piton style Interpol.Inside. The initial value of that style is \00_piton:n which means that the interpolations are parsed once again by piton.

```

1885
1886 local DoubleShortString =
1887   WithStyle ( 'String.Short' ,
1888     Q ( P "f\" + "F\" )
1889     *
1890     K ( 'String.Interpol' , "{}" )
1891     * K ( 'Interpol.Inside' , ( 1 - S "}":") ^ 0 )
1892     * ( K ( 'String.Interpol' , ":" ) * Q ( (1 - S "}":") ^ 0 ) ) ^ -1
1893     * K ( 'String.Interpol' , "}" )
1894     +
1895     VisualSpace
1896     +
1897     Q ( ( P "\\\\" + "{}" + "}" ) + 1 - S " {}\" ) ^ 1 )
1898     ) ^ 0
1899     * Q " \""
1900   +
1901   Q ( P "\\" + "r\" + "R\" )
1902   * ( Q ( ( P "\\\\" + 1 - S " \\" ) ^ 1 )
1903     + VisualSpace
1904     + PercentInterpol
1905     + Q "%"
1906     ) ^ 0
1907   * Q " \""
1908
1909 local ShortString = SingleShortString + DoubleShortString

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

1910 local braces =
1911   Compute_braces
1912   (
1913     ( P "\\" + "r\" + "R\" + "f\" + "F\" )
1914     * ( P "\\\\" + 1 - S " \\" ) ^ 0 * "\\" "
1915   +
1916     ( P '\' + 'r\' + 'R\' + 'f\' + 'F\' )
1917     * ( P '\\\\' + 1 - S '\\' ) ^ 0 * '\'
1918   )
1919 if piton.beamer then Beamer = Compute_Beamer ( 'python' , braces ) end

```

Detected commands

```
1920 DetectedCommands = Compute_DetectedCommands ( 'python' , braces )
```

LPEG_cleaner

```
1921 LPEG_cleaner['python'] = Compute_LPEG_cleaner ( 'python' , braces )
```

The long strings

```

1922 local SingleLongString =
1923   WithStyle ( 'String.Long' ,
1924     ( Q ( S "fF" * P "::::" )
1925       *
1926       K ( 'String.Interpol' , "{}" )
1927       * K ( 'Interpol.Inside' , ( 1 - S "}:\r" - "::::" ) ^ 0 )
1928       * Q ( P ":" * (1 - S "}:\r" - "::::" ) ^ 0 ) ^ -1
1929       * K ( 'String.Interpol' , "}" )
1930       +

```

```

1971   +
1972   PercentInterpol
1973   +
1974   P "%"
1975   +
1976   EOL
1977   ) ^ 0
1978 * Q "\"\"\""
1979 )
1980
1981 local LongString = SingleLongString + DoubleLongString

```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG DefFunction which deals with the whole preamble of a function definition (which begins with `def`).

```

1979 local StringDoc =
1980   K ( 'String.Doc' , P "r" ^ -1 * "\"\"\"")
1981   *
1982   ( K ( 'String.Doc' , ( 1 - P "\\"\"\" - "\\r" ) ^ 0 ) * EOL
1983   *
1984   Tab ^ 0
1985   ) ^ 0
1986   *
1987   K ( 'String.Doc' , ( 1 - P "\\"\"\" - "\\r" ) ^ 0 * "\"\"\"")

```

The comments in the Python listings We define different LPEG dealing with comments in the Python listings.

```

1985 local Comment =
1986   WithStyle ( 'Comment' ,
1987     Q "#" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
1988     * ( EOL + -1 )

```

DefFunction The following LPEG expression will be used for the parameters in the *argspec* of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

1989 local expression =
1990   P { "E" ,
1991     E = ( ""* ( P "\\" + 1 - S "'\r" ) ^ 0 * //!
1992       + "\\"* ( P "\\\\" + 1 - S "\"\r" ) ^ 0 * "\\""
1993       + "{} * V "F" * "}"
1994       + "(" * V "F" * ")"
1995       + "[" * V "F" * "]"
1996       + ( 1 - S "{}()[]\r," ) ) ^ 0 ,
1997     F = (   "{} * V "F" * "}"
1998       + "(" * V "F" * ")"
1999       + "[" * V "F" * "]"
2000       + ( 1 - S "{}()[]\r\\"" ) ) ^ 0
2001   }

```

We will now define a LPEG **Params** that will catch the list of parameters (that is to say the *argspec*) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG **Params** will be used to catch the chunk `a,b,x=10,n:int`.

```

2002 local Params =
2003   P { "E" ,
2004     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
2005     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
2006     * (
2007       K ( 'InitialValues' , "=" * expression )
2008       + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
2009     ) ^ -1
2010   }

```

The following LPEG **DefFunction** catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as **Comment**, **CommentLaTeX**, **Params**, **StringDoc**...

```

2011 local DefFunction =
2012   K ( 'Keyword' , "def" )
2013   * Space
2014   * K ( 'Name.Function.Internal' , identifier )
2015   * SkipSpace
2016   * Q "(" * Params * Q ")"
2017   * SkipSpace
2018   * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1

```

Here, we need a `piton` style `ParseAgain.noCR` which will be linked to `\@_piton_no_cr:n` (that means that the capture will be parsed once again by `piton`). We could avoid that kind of trick by using a non-terminal of a grammar but we have probably here a better legibility.

```

2019   * K ( 'ParseAgain.noCR' , ( 1 - S ":\r" ) ^ 0 )
2020   * Q ":" *
2021   * ( SkipSpace
2022     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
2023     * Tab ^ 0

```

```

2024     * SkipSpace
2025     * StringDoc ^ 0 -- there may be additional docstrings
2026 ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` must appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG Keyword (useful if, for example, the final user wants to speak of the keyword `def`).

Miscellaneous

```

2027 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL

```

The main LPEG for the language Python

```

2028 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1

```

First, the main loop :

```

2029 local Main =
2030     -- space ^ 1 * -1
2031     -- + space ^ 0 * EOL
2032     Space
2033     + Tab
2034     + Escape + EscapeMath
2035     + CommentLaTeX
2036     + Beamer
2037     + DetectedCommands
2038     + LongString
2039     + Comment
2040     + ExceptionInConsole
2041     + Delim
2042     + Operator
2043     + OperatorWord * EndKeyword
2044     + ShortString
2045     + Punct
2046     + FromImport
2047     + RaiseException
2048     + DefFunction
2049     + DefClass
2050     + For
2051     + Keyword * EndKeyword
2052     + Decorator
2053     + Builtin * EndKeyword
2054     + Identifier
2055     + Number
2056     + Word

```

Here, we must not put `local!`

```

2057 LPEG1['python'] = Main ^ 0

```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`³⁷.

```

2058 LPEG2['python'] =
2059     Ct (
2060         ( space ^ 0 * "\r" ) ^ -1
2061         * BeamerBeginEnvironments
2062         * PromptHastyDetection
2063         * Lc '\@@_begin_line:'
2064         * Prompt

```

³⁷Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2065     * SpaceIndentation ^ 0
2066     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2067     * -1
2068     * Lc '\\@@_end_line:'
2069 )

```

10.3.3 The language Ocaml

```

2070 local Delim = Q ( P "[" + "]" + S "[()]" )
2071 local Punct = Q ( S ",;:;" )

```

The identifiers caught by `cap_identifier` begin with a cap. In OCaml, it's used for the constructors of types and for the modules.

```

2072 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2073 local Constructor = K ( 'Name.Constructor' , cap_identifier )
2074 local ModuleType = K ( 'Name.Type' , cap_identifier )

```

The identifiers which begin with a lower case letter or an underscore are used elsewhere in OCaml.

```

2075 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2076 local Identifier = K ( 'Identifier' , identifier )

```

Now, we deal with the records because we want to catch the names of the fields of those records in all circumstances.

```

2077 local expression_for_fields =
2078   P { "E" ,
2079     E = (   "{" * V "F" * "}"
2080             + "(" * V "F" * ")"
2081             + "[" * V "F" * "]"
2082             + "\\" * ( P "\\\\" + 1 - S "\r" ) ^ 0 * "\\" "
2083             + "''" * ( P "\\'" + 1 - S "'\r" ) ^ 0 * "'"
2084             + ( 1 - S "{}()[]\r;" ) ) ^ 0 ,
2085     F = (   "{" * V "F" * "}"
2086             + "(" * V "F" * ")"
2087             + "[" * V "F" * "]"
2088             + ( 1 - S "{}()[]\r'"') ) ) ^ 0
2089   }
2090 local OneFieldDefinition =
2091   ( K ( 'Keyword' , "mutable" ) * SkipSpace ) ^ -1
2092   * K ( 'Name.Field' , identifier ) * SkipSpace
2093   * Q ":" * SkipSpace
2094   * K ( 'Name.Type' , expression_for_fields )
2095   * SkipSpace
2096
2097 local OneField =
2098   K ( 'Name.Field' , identifier ) * SkipSpace
2099   * Q "=" * SkipSpace
2100   * ( expression_for_fields
2101     / ( function ( s ) return LPEG1['ocaml'] : match ( s ) end )
2102   )
2103   * SkipSpace
2104
2105 local Record =
2106   Q "{" * SkipSpace
2107   *
2108   (
2109     OneFieldDefinition * ( Q ";" * SkipSpace * OneFieldDefinition ) ^ 0
2110     +
2111     OneField * ( Q ";" * SkipSpace * OneField ) ^ 0
2112   )
2113   *
2114   Q "}"

```

Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

2115 local DotNotation =
2116   (
2117     K ( 'Name.Module' , cap_identifier )
2118     * Q "."
2119     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{" ) ^ ( -1 )
2120     +
2121     Identifier
2122     * Q "."
2123     * K ( 'Name.Field' , identifier )
2124   )
2125   * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0

2127   K ( 'Operator' ,
2128     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "||" + "&&" +
2129     "/://" + "*%" + ";" + ":" + "->" + "+" + "-" + "*." + "/".
2130     + S "--+/*%=<>&@|")
2131
2132 local OperatorWord =
2133   K ( 'Operator.Word' ,
2134     P "and" + "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" )
2135
2136 local Keyword =
2137   K ( 'Keyword' ,
2138     P "assert" + "and" + "as" + "begin" + "class" + "constraint" + "done"
2139     + "downto" + "do" + "else" + "end" + "exception" + "external" + "for" +
2140     "function" + "functor" + "fun" + "if" + "include" + "inherit" + "initializer"
2141     + "in" + "lazy" + "let" + "match" + "method" + "module" + "mutable" + "new" +
2142     "object" + "of" + "open" + "private" + "raise" + "rec" + "sig" + "struct" +
2143     "then" + "to" + "try" + "type" + "value" + "val" + "virtual" + "when" +
2144     "while" + "with" )
2145   + K ( 'Keyword.Constant' , P "true" + "false" )
2146
2147 local Builtin =
2148   K ( 'Name.Builtin' , P "not" + "incr" + "decr" + "fst" + "snd" )

```

The following exceptions are exceptions in the standard library of OCaml (Stdlib).

```

2149 local Exception =
2150   K ( 'Exception' ,
2151     P "Division_by_zero" + "End_of_File" + "Failure" + "Invalid_argument" +
2152     "Match_failure" + "Not_found" + "Out_of_memory" + "Stack_overflow" +
2153     "Sys_blocked_io" + "Sys_error" + "Undefined_recursive_module" )

```

The characters in OCaml

```

2154 local Char =
2155   K ( 'String.Short' , ""* ( ( 1 - P "") ^ 0 + "\\" ) * "" )

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

2156 local braces = Compute_braces ( ""* ( 1 - S "\" ) ^ 0 * "\" )
2157 if piton.beamer then
2158   Beamer = Compute_Beamer ( 'ocaml' , braces ) -- modified 2024/07/24
2159 end
2160 DetectedCommands = Compute_DetectedCommands ( 'ocaml' , braces )

2161 LPEG_cleaner['ocaml'] = Compute_LPEG_cleaner ( 'ocaml' , braces )

```

The strings en OCaml We need a pattern `ocaml_string` without captures because it will be used within the comments of OCaml.

```

2162 local ocaml_string =
2163     Q "\""
2164     *
2165     VisualSpace
2166     +
2167     Q ( ( 1 - S " \r" ) ^ 1 )
2168     +
2169     EOL
2170     ) ^ 0
2171     * Q "\""
2172 local String = WithStyle ( 'String.Long' , ocaml_string )

```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua's long strings* in www.inf.puc-rio.br/~roberto/lpeg.

```

2173 local ext = ( R "az" + "_" ) ^ 0
2174 local open = "{" * Cg ( ext , 'init' ) * "|"
2175 local close = "|" * C ( ext ) * "}"
2176 local closeeq =
2177     Cmt ( close * Cb ( 'init' ) ,
2178             function ( s , i , a , b ) return a == b end )

```

The LPEG `QuotedStringBis` will do the second analysis.

```

2179 local QuotedStringBis =
2180     WithStyle ( 'String.Long' ,
2181     (
2182         Space
2183         +
2184         Q ( ( 1 - S " \r" ) ^ 1 )
2185         +
2186         EOL
2187     ) ^ 0 )

```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```

2188 local QuotedString =
2189     C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2190     ( function ( s ) return QuotedStringBis : match ( s ) end )

```

The comments in the OCaml listings In OCaml, the delimiters for the comments are `(*` and `*)`. There are unsymmetrical and OCaml allows those comments to be nested. That's why we need a grammar.

In these comments, we embed the math comments (between `$` and `$`) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

2191 local Comment =
2192     WithStyle ( 'Comment' ,
2193     P {
2194         "A" ,
2195         A = Q "(*"
2196         * ( V "A"
2197             + Q ( ( 1 - S "\r$\" - "(*" - "*") ) ^ 1 ) -- $
2198             + ocaml_string
2199             + "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * "$" -- $
2200             + EOL
2201         ) ^ 0

```

```

2202           * Q "*)""
2203     ) )

```

The DefFunction

```

2204 local balanced_parens =
2205   P { "E" , E = ( "(" * V "E" * ")" + 1 - S "()" ) ^ 0 }
2206 local Argument =
2207   K ( 'Identifier' , identifier )
2208   + Q "(" * SkipSpace
2209   * K ( 'Identifier' , identifier ) * SkipSpace
2210   * Q ":" * SkipSpace
2211   * K ( 'Name.Type' , balanced_parens ) * SkipSpace
2212   * Q ")"

```

Despite its name, then LPEG DefFunction deals also with `let open` which opens locally a module.

```

2213 local DefFunction =
2214   K ( 'Keyword' , "let open" )
2215   * Space
2216   * K ( 'Name.Module' , cap_identifier )
2217   +
2218   K ( 'Keyword' , P "let rec" + "let" + "and" )
2219   * Space
2220   * K ( 'Name.Function.Internal' , identifier )
2221   * Space
2222   * (
2223     Q "=" * SkipSpace * K ( 'Keyword' , "function" )
2224     +
2225     Argument
2226     * ( SkipSpace * Argument ) ^ 0
2227     * (
2228       SkipSpace
2229       * Q ":"*
2230       * K ( 'Name.Type' , ( 1 - P "=" ) ^ 0 )
2231     ) ^ -1
2232   )

```

The DefModule The following LPEG will be used in the definitions of modules but also in the definitions of *types* of modules.

```

2233 local DefModule =
2234   K ( 'Keyword' , "module" ) * Space
2235   *
2236   (
2237     K ( 'Keyword' , "type" ) * Space
2238     * K ( 'Name.Type' , cap_identifier )
2239   +
2240     K ( 'Name.Module' , cap_identifier ) * SkipSpace
2241   *
2242   (
2243     Q "(" * SkipSpace
2244     * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2245     * Q ":" * SkipSpace
2246     * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2247     *
2248     (
2249       Q "," * SkipSpace
2250       * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2251       * Q ":" * SkipSpace
2252       * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2253     ) ^ 0

```

```

2254             * Q ")"
2255         ) ^ -1
2256     *
2257     (
2258         Q "=" * SkipSpace
2259         * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2260         * Q "("
2261         * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2262         *
2263         (
2264             Q ","
2265             *
2266             K ( 'Name.Module' , cap_identifier ) * SkipSpace
2267             ) ^ 0
2268             * Q ")"
2269         ) ^ -1
2270     )
2271 +
2272 K ( 'Keyword' , P "include" + "open" )
2273 * Space * K ( 'Name.Module' , cap_identifier )

```

The parameters of the types

```
2274 local TypeParameter = K ( 'TypeParameter' , """ * alpha * # ( 1 - P """ ) )
```

The main LPEG for the language OCaml

```
2275 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1
```

First, the main loop :

```

2276 local Main =

2325     "const" + "constexpr" + "continue" + "decltype" + "do" + "else" + "enum" +
2326     "extern" + "for" + "goto" + "if" + "nexcept" + "private" + "public" +
2327     "register" + "restricted" + "return" + "static" + "static_assert" +
2328     "struct" + "switch" + "thread_local" + "throw" + "try" + "typedef" +
2329     "union" + "using" + "virtual" + "volatile" + "while"
2330   )
2331   + K ( 'Keyword.Constant' , P "default" + "false" + "NULL" + "nullptr" + "true" )
2332
2333 local Builtin =
2334   K ( 'Name.Builtin' ,
2335     P "alignof" + "malloc" + "printf" + "scanf" + "sizeof" )
2336
2337 local Type =
2338   K ( 'Name.Type' ,
2339     P "bool" + "char" + "char16_t" + "char32_t" + "double" + "float" + "int" +
2340     "int8_t" + "int16_t" + "int32_t" + "int64_t" + "long" + "short" + "signed"
2341     + "unsigned" + "void" + "wchar_t" ) * Q "*" ^ 0
2342
2343 local DefFunction =
2344   Type
2345   * Space
2346   * Q "*" ^ -1
2347   * K ( 'Name.Function.Internal' , identifier )
2348   * SkipSpace
2349   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

³⁸Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```
2350 local DefClass =
2351   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The strings of C

```
2352 String =
2353   WithStyle ( 'String.Long' ,
2354     Q "\""
2355     * ( VisualSpace
2356       + K ( 'String.Interpol' ,
2357         "%" * ( S "difcspxYou" + "ld" + "li" + "hd" + "hi" )
2358         )
2359       + Q ( ( P "\\\\" + 1 - S " \"\\"" ) ^ 1 )
2360     ) ^ 0
2361   * Q "\""
2362 )
```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```
2363 local braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2364 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
2365 DetectedCommands = Compute_DetectedCommands ( 'c' , braces )
2366 LPEG_cleaner['c'] = Compute_LPEG_cleaner ( 'c' , braces )
```

The directives of the preprocessor

```
2367 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )
```

The comments in the C listings We define different LPEG dealing with comments in the C listings.

```
2368 local Comment =
2369   WithStyle ( 'Comment' ,
2370     Q("//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2371     * ( EOL + -1 )
2372
2373 local LongComment =
2374   WithStyle ( 'Comment' ,
2375     Q "/*"
2376     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2377     * Q "*/"
2378   ) -- $
```

The main LPEG for the language C

```
2379 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1
```

First, the main loop :

```
2380 local Main =
2381     Space
2382     + Tab
2383     + Escape + EscapeMath
2384     + CommentLaTeX
2385     + Beamer
2386     + DetectedCommands
2387     + Preproc
2388     + Comment + LongComment
2389     + Delim
2390     + Operator
2391     + String
2392     + Punct
2393     + DefFunction
2394     + DefClass
2395     + Type * ( Q "*" ^ -1 + EndKeyword )
2396     + Keyword * EndKeyword
2397     + Builtin * EndKeyword
2398     + Identifier
2399     + Number
2400     + Word
```

Here, we must not put local!

```
2401 LPEG1['c'] = Main ^ 0
```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@_begin_line: - @_end_line:`³⁹.

```
2402 LPEG2['c'] =
2403     Ct (
2404         ( space ^ 0 * P "\r" ) ^ -1
2405         * BeamerBeginEnvironments
2406         * Lc '\@_begin_line:'
2407         * SpaceIndentation ^ 0
2408         * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2409         * -1
2410         * Lc '\@_end_line:'
2411     )
```

10.3.5 The language SQL

```
2412 local function LuaKeyword ( name )
2413     return
2414     Lc [[{\PitonStyle{Keyword}[]}]
2415     * Q ( Cmt (
2416             C ( identifier ) ,
2417             function ( s , i , a ) return string.upper ( a ) == name end
2418         )
2419     )
2420     * Lc "}}"
2421 end
```

In the identifiers, we will be able to catch those containing spaces, that is to say like "last name".

```
2422 local identifier =
2423     letter * ( alphanum + "-" ) ^ 0
```

³⁹Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

```

2424     + '"" * ( ( alphanum + space - '"" ) ^ 1 ) * '""  

2425  

2426  

2427 local Operator =  

2428 K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*+/" )  

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch  

the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However,  

some keywords will be caught in special LPEG because we want to detect the names of the SQL  

tables.  

2429 local function Set ( list )  

2430   local set = { }  

2431   for _, l in ipairs ( list ) do set[l] = true end  

2432   return set  

2433 end  

2434  

2435 local set_keywords = Set  

2436 {  

2437   "ADD" , "AFTER" , "ALL" , "ALTER" , "AND" , "AS" , "ASC" , "BETWEEN" , "BY" ,  

2438   "CHANGE" , "COLUMN" , "CREATE" , "CROSS JOIN" , "DELETE" , "DESC" , "DISTINCT" ,  

2439   "DROP" , "FROM" , "GROUP" , "HAVING" , "IN" , "INNER" , "INSERT" , "INTO" , "IS" ,  

2440   "JOIN" , "LEFT" , "LIKE" , "LIMIT" , "MERGE" , "NOT" , "NULL" , "ON" , "OR" ,  

2441   "ORDER" , "OVER" , "RIGHT" , "SELECT" , "SET" , "TABLE" , "THEN" , "TRUNCATE" ,  

2442   "UNION" , "UPDATE" , "VALUES" , "WHEN" , "WHERE" , "WITH"  

2443 }  

2444  

2445 local set_builtins = Set  

2446 {  

2447   "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,  

2448   "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,  

2449   "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"  

2450 }

```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

2451 local Identifier =  

2452   C ( identifier ) /  

2453   (  

2454     function (s)  

2455       if set_keywords[string.upper(s)] -- the keywords are case-insensitive in SQL  

Remind that, in Lua, it's possible to return several values.  

2456       then return { {"\\PitonStyle{Keyword}"} ,  

2457                     { luatexbase.catcodetables.other , s } ,  

2458                     { "}" } }  

2459     else if set_builtins[string.upper(s)]  

2460       then return { {"\\PitonStyle{Name.Builtin}"} ,  

2461                     { luatexbase.catcodetables.other , s } ,  

2462                     { "}" } }  

2463     else return { {"\\PitonStyle{Name.Field}"} ,  

2464                     { luatexbase.catcodetables.other , s } ,  

2465                     { "}" } }  

2466     end  

2467   end  

2468 end  

2469 )

```

The strings of SQL

```

2470 local String = K ( 'String.Long' , '"" * ( 1 - P "" ) ^ 1 * "" )
```

Beamer The argument of `Compute_braces` must be a pattern which does no catching corresponding to the strings of the language.

```

2471 local braces = Compute_braces ( "" * ( 1 - P "" ) ^ 1 * "" )
2472 if piton.beamer then Beamer = Compute_Beamer ( 'sql' , braces ) end
2473 DetectedCommands = Compute_DetectedCommands ( 'sql' , braces )
2474 LPEG_cleaner['sql'] = Compute_LPEG_cleaner ( 'sql' , braces )

```

The comments in the SQL listings We define different LPEG dealing with comments in the SQL listings.

```

2475 local Comment =
2476   WithStyle ( 'Comment' ,

2616 %
2617 % \medskip
2618 % The function |Parse| is the main function of the package \pkg{piton}. It
2619 % parses its argument and sends back to LaTeX the code with interlaced
2620 % formatting LaTeX instructions. In fact, everything is done by the
2621 % \textsc{lpeg} corresponding to the considered language (|LPEG2[language]|)
2622 % which returns as capture a Lua table containing data to send to LaTeX.
2623 %
2624 % \bigskip
2625 % \begin{macrocode}
2626 function piton.Parse ( language , code )
2627     local t = LPEG2[language] : match ( code )
2628     if t == nil
2629     then
2630         sprintL3 [[ \@@_error_or_warning:n { SyntaxError } ]]
2631         return -- to exit in force the function

```

```

2632     end
2633     local left_stack = {}
2634     local right_stack = {}
2635     for _, one_item in ipairs ( t ) do
2636         if one_item[1] == "EOL" then
2637             for _, s in ipairs ( right_stack ) do
2638                 tex.sprint ( s )
2639             end
2640             for _, s in ipairs ( one_item[2] ) do
2641                 tex.tprint ( s )
2642             end
2643             for _, s in ipairs ( left_stack ) do
2644                 tex.sprint ( s )
2645             end
2646         else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}<2>" , "\end{uncover}" }
```

In order to deal with the ends of lines, we have to close the environment (`\begin{uncover}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}<2>` and `right_stack` will be for the elements like `\end{uncover}`.

```

2647     if one_item[1] == "Open" then
2648         tex.sprint( one_item[2] )
2649         table.insert ( left_stack , one_item[2] )
2650         table.insert ( right_stack , one_item[3] )
2651     else
2652         if one_item[1] == "Close" then
2653             tex.sprint ( right_stack[#right_stack] )
2654             left_stack[#left_stack] = nil
2655             right_stack[#right_stack] = nil
2656         else
2657             tex.tprint ( one_item )
2658         end
2659     end
2660   end
2661 end
2662 end

```

The function `ParseFile` will be used by the LaTeX command `\PitonInputFile`. That function merely reads the file (between `first_line` and `last_line`) and then apply the function `Parse` to the resulting Lua string.

```

2663 function piton.ParseFile ( language , name , first_line , last_line , split )
2664   local s = ''
2665   local i = 0
2666   for line in io.lines ( name ) do
2667     i = i + 1
2668     if i >= first_line then
2669       s = s .. '\r' .. line
2670     end
2671     if i >= last_line then break end
2672   end

```

We extract the BOM of utf-8, if present.

```

2673   if string.byte ( s , 1 ) == 13 then
2674     if string.byte ( s , 2 ) == 239 then
2675       if string.byte ( s , 3 ) == 187 then
2676         if string.byte ( s , 4 ) == 191 then
2677           s = string.sub ( s , 5 , -1 )
2678         end
2679       end
2680     end
2681   end
2682   if split == 1 then

```

```

2683     piton.GobbleSplitParse ( language , 0 , s )
2684   else
2685     sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]
2686     piton.Parse ( language , s )
2687     sprintL3
2688       [ [\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]
2689   end
2690 end

```

10.3.7 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols #.

```

2691 function piton.ParseBis ( lang , code )
2692   local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( code )
2693   return piton.Parse ( lang , s )
2694 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```
2695 function piton.ParseTer ( lang , code )
```

Be careful: we have to write `[[\@@_breakable_space:]]` with a space after the name of the LaTeX command `\@@_breakable_space::`.

```

2696   local s = ( Cs ( ( P [[\@@_breakable_space: ]] / ' ' + 1 ) ^ 0 ) )
2697           : match ( code )
2698   return piton.Parse ( lang , s )
2699 end

```

10.3.8 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```

2700 local AutoGobbleLPEG =
2701   (
2702     P " " ^ 0 * "\r"
2703     +
2704     Ct ( C " " ^ 0 ) / table.getn
2705     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
2706   ) ^ 0
2707   * ( Ct ( C " " ^ 0 ) / table.getn
2708     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2709 ) / math.min

```

The following LPEG is similar but works with the tabulations.

```

2710 local TabsAutoGobbleLPEG =
2711   (
2712     (
2713       P "\t" ^ 0 * "\r"
2714       +
2715       Ct ( C "\t" ^ 0 ) / table.getn
2716       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
2717     ) ^ 0
2718     * ( Ct ( C "\t" ^ 0 ) / table.getn
2719       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2720   ) / math.min

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```

2721 local EnvGobbleLPEG =
2722     ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
2723     * Ct ( C " " ^ 0 * -1 ) / table.getn
2724 local function remove_before_cr ( input_string )
2725     local match_result = ( P "\r" ) : match ( input_string )
2726     if match_result then
2727         return string.sub ( input_string , match_result )
2728     else
2729         return input_string
2730     end
2731 end

```

The function `gobble` gobbles n characters on the left of the code. The negative values of n have special significations.

```

2732 local function gobble ( n , code )
2733     code = remove_before_cr ( code )
2734     if n == 0 then
2735         return code
2736     else
2737         if n == -1 then
2738             n = AutoGobbleLPEG : match ( code )
2739         else
2740             if n == -2 then
2741                 n = EnvGobbleLPEG : match ( code )
2742             else
2743                 if n == -3 then
2744                     n = TabsAutoGobbleLPEG : match ( code )
2745                 end
2746             end
2747         end
2748     end

```

We have a second test `if n == 0` because the, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

2748     if n == 0 then
2749         return code
2750     else

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of n .

```

2751     return
2752     ( Ct (
2753         ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2754             * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2755             ) ^ 0 )
2756         / table.concat
2757     ) : match ( code )
2758     end
2759 end
2760 end

```

In the following code, n is the value of `\l_@@_gobble_int`.

```

2761 function piton.GobbleParse ( lang , n , code )
2762     piton.last_code = gobble ( n , code )
2763     piton.last_language = lang
2764     piton.CountLines ( piton.last_code )
2765     sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes ]]

```

We begin a `\vtop` for a non-splittable block of lines.

```
2766   sprintL3 [[ \vtop \bgroup ]]
2767   piton.Parse ( lang , piton.last_code )
```

We close the latest opened `\vtop` with the following `\egroup`. Be careful: that `\vtop` is *not* necessarily the `\vtop` opened two lines above because the commands `\@_newline:` inserted by Lua may open and close `\vtops` and start and finish paragraphs (when `splittable` is in force).

```
2768   sprintL3 [[ \vspace{2.5pt} \egroup ]]
2769   sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \endsavenotes ]]
```

We finish the paragraph (each block of non-splittable lines of code is composed in a `\vtop` inserted in a paragraph).

```
2770   sprintL3 [[ \par ]]
```

Now, if the final user has used the key `write` to write the code of the environment on an external file.

```
2771   if piton.write and piton.write ~= '' then
2772     local file = assert ( io.open ( piton.write , piton.write_mode ) )
2773     file:write ( piton.get_last_code ( ) )
2774     file:close ( )
2775   end
2776 end
```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the informatic code is split in chunks at the empty lines (usually between the informatic functions defined in the informatic code). LaTeX will be able to change the page between the chunks. The second argument `n` corresponds to the value of the key `gobble` (number of spaces to gobble).

```
2777 function piton.GobbleSplitParse ( lang , n , code )
2778   P { "E" ,
2779     E = ( V "F"
2780       * ( P " " ^ 0 * "\r"
2781         / ( function ( x ) sprintL3 [[ \@_incr_visual_line: ]] end )
2782         ) ^ 1
2783         / ( function ( x )
2784           sprintL3 ( piton.string_between_chunks )
2785           end )
2786         ) ^ 0 * V "F" ,
```

The non-terminal `F` corresponds to a chunk of the informatic code.

```
2787   F = C ( V "G" ^ 0 )
```

The second argument of `piton.GobbleSplitParse` is the argument `gobble`: we put that argument to 0 because we will have gobbled previously the whole argument `code` (see below).

```
2788   / ( function ( x ) piton.GobbleParse ( lang , 0 , x ) end ) ,
```

The non-terminal `G` corresponds to a non-empty line of code.

```
2789   G = ( 1 - P "\r" ) ^ 0 * "\r" - ( P " " ^ 0 * "\r" )
2790   + ( ( 1 - P "\r" ) ^ 1 * -1 - ( P " " ^ 0 * -1 ) )
2791 } : match ( gobble ( n , code ) )
2792 end
```

The following Lua string will be inserted between the chunks of code created when the key `split-on-empty-lines` is in force. It's used only once: you have given a name to that Lua string only for legiblity. The token list `\l_@@_split_separation_tl` corresponds to the key `split-separation`. That token list must contain elements inserted in *vertical mode* of TeX.

```
2793 piton.string_between_chunks =
2794 [[ \par \l_@@_split_separation_tl \mode_leave_vertical: ]]
2795 .. [[ \int_gzero:N \g_@@_line_int ]]
```

The counter `\g_@@_line_int` will be used to control the points where the code may be broken by a change of page (see the key `splittable`).

The following public Lua function is provided to the developer.

```
2796 function piton.get_last_code ( )
2797     return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
2798 end
```

10.3.9 To count the number of lines

The following function is only used once (in `piton.GobbleParse`). We have written an autonomous function only for legibility. The number of lines of the code will be stored in `\l_@@_nb_lines_int` and will be used to allow or disallow line breaks (when `splittable` is in force).

```
2799 function piton.CountLines ( code )
2800     local count = 0
2801     for i in code : gmatch ( "\r" ) do count = count + 1 end
2802     sprintL3 ( string.format ( [[ \int_set:Nn \l_@@_nb_lines_int { % i } ]] , count ) )
2803 end
```

The following function is only used once (in `piton.GobbleParse`). We have written an autonomous function only for legibility. The number of lines of the code will be stored in `\l_@@_nb_non_empty_lines_int`. It will be used to compute the largest number of lines to write (when `line-numbers` is in force).

```
2804 function piton.CountNonEmptyLines ( code )
2805     local count = 0
2806     count =
2807         ( Ct ( ( P " " ^ 0 * "\r"
2808                 + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
2809                 * ( 1 - P "\r" ) ^ 0
2810                 * -1
2811             ) / table.getn
2812         ) : match ( code )
2813     sprintL3
2814     ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { % i } ]] , count ) )
2815 end

2816 function piton.CountLinesFile ( name )
2817     local count = 0
2818     for line in io.lines ( name ) do count = count + 1 end
2819     sprintL3
2820     ( string.format ( [[ \int_set:Nn \l_@@_nb_lines_int { %i } ]] , count ) )
2821 end

2822 function piton.CountNonEmptyLinesFile ( name )
2823     local count = 0
2824     for line in io.lines ( name )
2825     do if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
2826         count = count + 1
2827     end
2828     end
2829     sprintL3
2830     ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { % i } ]] , count ) )
2831 end
```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```
2832 function piton.ComputeRange(marker_beginning,marker_end,file_name)
```

```

2833 local s = ( Cs (( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
2834 local t = ( Cs (( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
2835 local first_line = -1
2836 local count = 0
2837 local last_found = false
2838 for line in io.lines ( file_name )
2839 do if first_line == -1
2840     then if string.sub ( line , 1 , #s ) == s
2841         then first_line = count
2842         end
2843     else if string.sub ( line , 1 , #t ) == t
2844         then last_found = true
2845         break
2846         end
2847     end
2848     count = count + 1
2849 end
2850 if first_line == -1
2851 then sprintL3 [[ \@@_error_or_warning:n { begin~marker~not~found } ]]
2852 else if last_found == false
2853     then sprintL3 [[ \@@_error_or_warning:n { end~marker~not~found } ]]
2854     end
2855 end
2856 sprintL3 (
2857     [[ \int_set:Nn \l_@@_first_line_int { } ] .. first_line .. ' + 2 ']
2858     .. [[ \int_set:Nn \l_@@_last_line_int { } ] .. count .. ' ] )
2859 end

```

10.3.10 To create new languages with the syntax of listings

```

2860 function piton.new_language ( lang , definition )
2861     lang = string.lower ( lang )

2862     local alpha , digit = lpeg.alpha , lpeg.digit
2863     local extra_letters = { "@" , "_" , "$" } -- $

```

The command `add_to_letter` (triggered by the key `o`) don't write right away in the LPEG pattern of the letters in an intermediate `extra_letters` because we may have to retrieve letters from that "list" if there appear in a key `alsoother`.

```

2864     function add_to_letter ( c )
2865         if c ~= " " then table.insert ( extra_letters , c ) end
2866     end

```

For the digits, it's straightforward.

```

2867     function add_to_digit ( c )
2868         if c ~= " " then digit = digit + c end
2869     end

```

The main use of the key `alsoother` is, for the language LaTeX, when you have to retrieve some characters from the list of letters, in particular `@` and `_` (which, by default, are not allowed in the name of a control sequence in TeX).

(In the following LPEG we have a problem when we try to add `{` and `}`).

```

2870     local other = S ":_@+-*/<>!?;.:()~^=#!&\"\\\$" -- $
2871     local extra_others = { }
2872     function add_to_other ( c )
2873         if c ~= " " then

```

We will use `extra_others` to retrieve further these characters from the list of the letters.

```

2874         extra_others[c] = true

```

The LPEG pattern `other` will be used in conjunction with the key `tag` (mainly for the language HTML) for the character `/` in the closing tags `</....>`.

```

2875     other = other + P ( c )
2876   end
2877 end

```

Of course, the LPEG `strict_braces` is for balanced braces (without the question of strings of an informatic language). In fact, it *won't* be used for an informatic language (as dealt by `piton`) but for LaTeX instructions;

```

2878 local strict_braces =
2879   P { "E" ,
2880     E = ( "{" * V "F" * "}" + ( 1 - S ",{}" ) ) ^ 0 ,
2881     F = ( "{" * V "F" * "}" + ( 1 - S "{}" ) ) ^ 0
2882   }

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument `definition` of `piton.new_language`.

```

2883 local cut_definition =
2884   P { "E" ,
2885     E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
2886     F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
2887               * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
2888   }
2889 local def_table = cut_definition : match ( definition )

```

The definition of the language, provided by the final user of `piton` is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

2890 local tex_braced_arg = "{" * C ( ( 1 - P ")" ) ^ 0 ) * "}"
2891 local tex_arg = tex_braced_arg + C ( 1 )
2892 local tex_option_arg = "[" * C ( ( 1 - P ")" ) ^ 0 ) * "]" + Cc ( nil )
2893 local args_for_tag
2894   = tex_option_arg
2895   * space ^ 0
2896   * tex_arg
2897   * space ^ 0
2898   * tex_arg
2899 local args_for_morekeywords
2900   = "[" * C ( ( 1 - P ")" ) ^ 0 ) * "]"
2901   * space ^ 0
2902   * tex_option_arg
2903   * space ^ 0
2904   * tex_arg
2905   * space ^ 0
2906   * ( tex_braced_arg + Cc ( nil ) )
2907 local args_for_moredelims
2908   = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
2909   * args_for_morekeywords
2910 local args_for_morecomment
2911   = "[" * C ( ( 1 - P ")" ) ^ 0 ) * "]"
2912   * space ^ 0
2913   * tex_option_arg
2914   * space ^ 0
2915   * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

2916 local sensitive = true
2917 local style_tag , left_tag , right_tag
2918 for _ , x in ipairs ( def_table ) do

```

```

2919 if x[1] == "sensitive" then
2920   if x[2] == nil or ( P "true" ) : match ( x[2] ) then
2921     sensitive = true
2922   else
2923     if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
2924   end
2925 end
2926 if x[1] == "alsodigit" then x[2] : gsub ( ".", add_to_digit ) end
2927 if x[1] == "alsoletter" then x[2] : gsub ( ".", add_to_letter ) end
2928 if x[1] == "alsoother" then x[2] : gsub ( ".", add_to_other ) end
2929 if x[1] == "tag" then
2930   style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
2931   style_tag = style_tag or [\\PitonStyle{Tag}]
2932 end
2933 end

```

Now, the LPEG for the numbers. Of course, it uses `digit` previously computed.

```

2934 local Number =
2935   K ( 'Number' ,
2936     ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
2937       + digit ^ 0 * "." * digit ^ 1
2938       + digit ^ 1 )
2939     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
2940     + digit ^ 1
2941   )
2942 local string_extra_letters = ""
2943 for _ , x in ipairs ( extra_letters ) do
2944   if not ( extra_others[x] ) then
2945     string_extra_letters = string_extra_letters .. x
2946   end
2947 end
2948 local letter = alpha + S ( string_extra_letters )
2949   + P "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "ï" + "î"
2950   + "ô" + "û" + "ü" + "Â" + "Ã" + "Ç" + "É" + "È" + "Ê" + "Ë"
2951   + "î" + "Ï" + "Ô" + "Ü" + "Ü"
2952 local alphanum = letter + digit
2953 local identifier = letter * alphanum ^ 0
2954 local Identifier = K ( 'Identifier' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

2955 local split_clist =
2956   P { "E" ,
2957     E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1
2958     * ( P "{" ) ^ 1
2959     * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
2960     * ( P "}" ) ^ 1 * space ^ 0 ,
2961     F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
2962   }

```

The following function will be used if the keywords are not case-sensitive.

```

2963 local function keyword_to_lpeg ( name )
2964 return
2965   Q ( Cmt (
2966     C ( identifier ) ,
2967     function(s,i,a) return string.upper(a) == string.upper(name) end
2968   )
2969 )
2970 end
2971 local Keyword = P ( false )
2972 local PrefixedKeyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

2973 for _ , x in ipairs ( def_table )

```

```

2974 do if x[1] == "morekeywords"
2975     or x[1] == "otherkeywords"
2976     or x[1] == "moredirectives"
2977     or x[1] == "moretexcs"
2978 then
2979     local keywords = P ( false )
2980     local style = [[\PitonStyle{Keyword}]]
2981     if x[1] == "moredirectives" then style = [[ \PitonStyle{Directive} ]] end
2982     style = tex_option_arg : match ( x[2] ) or style
2983     local n = tonumber ( style )
2984     if n then
2985         if n > 1 then style = [[\PitonStyle{Keyword}] .. style .. "}] end
2986     end
2987     for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
2988         if x[1] == "moretexcs" then
2989             keywords = Q ( [[\]] .. word ) + keywords
2990         else
2991             if sensitive

```

The documentation of `lstlistings` specifies that, for the key `morekeywords`, if a keyword is a prefix of another keyword, then the prefix must appear first. However, for the lpeg, it's rather the contrary. That's why, here, we add the new element *on the left*.

```

2992     then keywords = Q ( word ) + keywords
2993     else keywords = keyword_to_lpeg ( word ) + keywords
2994     end
2995     end
2996 end
2997 Keyword = Keyword +
2998     Lc ( "{" .. style .. "{" .. * keywords * Lc "}" }
2999 end

```

Of course, the feature with the key `keywordsprefix` is designed for the languages TeX, LaTeX, et al. In that case, there is two kinds of keywords (= control sequences).

- those beginning with `\` and a sequence of characters of catcode “letter”;
- those beginning by `\` followed by one character of catcode “other”.

The following code addresses both cases. Of course, the LPEG pattern `letter` must catch only characters of catcode “letter”. That's why we have a key `alsoletter` to add new characters in that category (e.g. : when we want to format L3 code). However, the LPEG pattern is allowed to catch *more* than only the characters of catcode “other” in TeX.

```

3000 if x[1] == "keywordsprefix" then
3001     local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
3002     PrefixedKeyword = PrefixedKeyword
3003     + K ( 'Keyword' , P ( prefix ) * ( letter ^ 1 + other ) )
3004 end
3005 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

3006 local long_string = P ( false )
3007 local Long_string = P ( false )
3008 local LongString = P ( false )
3009 local central_pattern = P ( false )
3010 for _ , x in ipairs ( def_table ) do
3011     if x[1] == "morestring" then
3012         arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
3013         arg2 = arg2 or [[\PitonStyle{String.Long}]]
3014         if arg1 ~= "s" then
3015             arg4 = arg3
3016         end
3017         central_pattern = 1 - S ( " \r" .. arg4 )
3018         if arg1 : match "b" then
3019             central_pattern = P ( [[\]] .. arg3 ) + central_pattern
3020         end

```

In fact, the specifier `d` is point-less: when it is not in force, it's still possible to double the delimiter with a correct behaviour of piton since, in that case, piton will compose *two* contiguous strings...

```
3021     if arg1 : match "d" or arg1 == "m" then
3022         central_pattern = P ( arg3 .. arg3 ) + central_pattern
3023     end
3024     if arg1 == "m"
3025     then prefix = lpeg.B ( 1 - letter - ")" - "]" )
3026     else prefix = P ( true )
3027     end
```

First, a pattern *without captures* (needed to compute braces).

```
3028     long_string = long_string +
3029         prefix
3030         * arg3
3031         * ( space + central_pattern ) ^ 0
3032         * arg4
```

Now a pattern *with captures*.

```
3033     local pattern =
3034         prefix
3035         * Q ( arg3 )
3036         * ( VisualSpace + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
3037         * Q ( arg4 )
```

We will need `Long_string` in the nested comments.

```
3038     Long_string = Long_string + pattern
3039     LongString = LongString +
3040         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3041         * pattern
3042         * Ct ( Cc "Close" )
3043     end
3044 end
```

The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```
3045     local braces = Compute_braces ( long_string )
3046     if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
3047
3048     DetectedCommands = Compute_DetectedCommands ( lang , braces )
3049
3050     LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )
```

Now, we deal with the comments and the delims.

```
3051     local CommentDelim = P ( false )
3052
3053     for _ , x in ipairs ( def_table ) do
3054         if x[1] == "morecomment" then
3055             local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
3056             arg2 = arg2 or [[\PitonStyle{Comment}]]
```

If the letter `i` is present in the first argument (eg: `morecomment = [si]{(*){}}`, then the corresponding comments are discarded.

```
3057     if arg1 : match "i" then arg2 = [[\PitonStyle{Discard}]] end
3058     if arg1 : match "l" then
3059         local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
3060             : match ( other_args )
3061         if arg3 == [[\#]] then arg3 = "#" end -- mandatory
3062         CommentDelim = CommentDelim +
3063             Ct ( Cc "Open"
3064                 * Cc ( "{" .. arg2 .. "}" * Cc "}" )
3065                 * Q ( arg3 )
3066                 * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
3067                 * Ct ( Cc "Close" )
3068                 * ( EOL + -1 )
```

```

3069     else
3070         local arg3 , arg4 =
3071             ( tex_arg * space ^ 0 * tex_arg ) : match ( other_args )
3072             if arg1 : match "s" then
3073                 CommentDelim = CommentDelim +
3074                     Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3075                     * Q ( arg3 )
3076                     *
3077                         CommentMath
3078                             + Q ( ( 1 - P ( arg4 ) - S "$\r" ) ^ 1 ) -- $
3079                             + EOL
3080                             ) ^ 0
3081                             * Q ( arg4 )
3082                             * Ct ( Cc "Close" )
3083             end
3084             if arg1 : match "n" then
3085                 CommentDelim = CommentDelim +
3086                     Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3087                     * P { "A" ,
3088                         A = Q ( arg3 )
3089                         *
3090                             ( V "A"
3091                                 + Q ( ( 1 - P ( arg3 ) - P ( arg4 )
3092                                     - S "\r$\" ) ^ 1 ) -- $
3093                                     + long_string
3094                                     + "$" -- $
3095                                         * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) -- $
3096                                         * "$" -- $
3097                                         + EOL
3098                                         ) ^ 0
3099                                         * Q ( arg4 )
3100                         }
3101                         * Ct ( Cc "Close" )
3102             end
3103         end

```

For the keys `moredelim`, we have to add another argument in first position, equal to `*` or `**`.

```

3104     if x[1] == "moredelim" then
3105         local arg1 , arg2 , arg3 , arg4 , arg5
3106             = args_for_moredelims : match ( x[2] )
3107             local MyFun = Q
3108             if arg1 == "*" or arg1 == "**" then
3109                 MyFun = function ( x ) return K ( 'ParseAgain.noCR' , x ) end
3110             end
3111             local left_delim
3112             if arg2 : match "i" then
3113                 left_delim = P ( arg4 )
3114             else
3115                 left_delim = Q ( arg4 )
3116             end
3117             if arg2 : match "l" then
3118                 CommentDelim = CommentDelim +
3119                     Ct ( Cc "Open" * Cc ( "{" .. arg3 .. "}" * Cc "}" ) )
3120                     * left_delim
3121                     * ( MyFun ( ( 1 - P "\r" ) ^ 1 ) ) ^ 0
3122                     * Ct ( Cc "Close" )
3123                     * ( EOL + -1 )
3124             end
3125             if arg2 : match "s" then
3126                 local right_delim
3127                 if arg2 : match "i" then
3128                     right_delim = P ( arg5 )
3129                 else
3130                     right_delim = Q ( arg5 )

```

```

3131     end
3132     CommentDelim = CommentDelim +

11 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension `piton` is done on the following GitHub repository:

<https://github.com/fpantigny/piton>

Changes between versions 3.0 and 3.1

Keys `line-numbers/format`, `detected-beamer-commands` and `detected-beamer-environments`.

Changes between versions 2.8 and 3.0

New command `\NewPitonLanguage`. Thanks to that command, it's now possible to define new informatic languages with the syntax used by `listings`. Therefore, it's possible to say that virtually all the informatic languages are now supported by `piton`.

Changes between versions 2.7 and 2.8

The key `path` now accepts a *list* of paths where the files to include will be searched.

New commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF`.

Changes between versions 2.6 and 2.7

New keys `split-on-empty-lines` and `split-separation`

Changes between versions 2.5 and 2.6

API: `piton.last_code` and `\g_piton_last_code_t1` are provided.

Changes between versions 2.4 and 2.5

New key `path-write`

Changes between versions 2.3 and 2.4

The key `identifiers` of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

Changes between versions 2.2 and 2.3

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

Changes between versions 2.1 and 2.2

New key `path` for `\PitonOptions`.

New language SQL.

It’s now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.
