This is a list of all substantial corrections made to Computers & Typesetting since the beginning of 2014. (More precisely, it lists errors corrected since the 19th printing of Volume A, the 9th printing of Volume B, the 8th printing of Volume C, the 6th printing of Volume D, and the 7th printing of Volume E. But it omits changes that are "purely cosmetic.") Corrections made to the softcover version of The T_EXbook , beginning with its 32nd printing, are the same as corrections to Volume A. Corrections to the softcover version of The METAFONT book, beginning with its 11th printing, are the same as corrections to Volume C. Changes to the mini-indexes and master indexes of Volumes B, D, and E are not shown here unless they are not obviously derivable from what has been shown. Some (or all) of these errors have been corrected in the most recent printings.

Such displays of box contents will be discussed further in Chapters 12 and 27.

Page A105, lines 9–16

If you say \vadjust{\ vertical mode material \} within a paragraph, TEX will use internal vertical mode to insert the specified material into the vertical list that encloses the paragraph, immediately after whatever line contained the position of the \vadjust. For example, you can say '\vadjust{\kern1pt}' to increase the amount of space between lines of a paragraph if those lines would otherwise come out too close together. (The author did that in the current line, just to illustrate what happens.) Also, if you want to make sure that a page break will occur immediately after a certain line, you can say '\vadjust{\eject}' anywhere in that line.

 \mathbb{t}

|--|

dividual symbols; <code>left...\right</code> constructions are treated as "inner" subformulas, which means that they will be surrounded by additional space in certain circumstances. All other subformulas are generally treated as ordinary symbols, whether they are formed by <code>\overline</code> or <code>\hbox</code> or <code>\vcenter</code> or by simply being enclosed in braces. Thus, <code>\mathord</code> isn't really a necessary part of the TEX language; instead of typing <code>`\$1\mathord,234\$'</code>, you can get the same effect from <code>`\$1{,}234\$'</code>.

Inner is an inner atom produced by '\left...\right';

Page A170, lines 18 and 19	(12/10/18)
----------------------------	------------

subformulas delimited by **\left** and **\right** are treated as type Inner. The following table is used to determine the spacing between pairs of adjacent atoms:

Page A171, line 19 from the bottom	(06/15/19)

formula produces a result essentially equivalent to `\left($\langle subformula \rangle \rangle$, when

Braces are used for grouping, when supplying arguments to macros; so they cannot also be used as math delimiters, or as arguments to macros such as **\big**. (One could change their catcodes to 12, and use some other pair of characters for grouping; but that would not be plain $T_{\rm F}X$.)

Page A346, lines 10–22 (11,	/24	/19))
-----------------------------	-----	-----	----

number identification.) (2) The registers $\count255$, $\dimen255$, $\stip255$, $\toks255$, and $\muskip255$ are freely available in the same way. (3) All assignments to the scratch registers whose numbers are 1, 3, 5, 7, and 9 should be \global ; all assignments to the other scratch registers (0, 2, 4, 6, 8, 255) should be non- \global . (This prevents the phenomenon of "save stack buildup" discussed in Chapter 27.) (4) Furthermore, it's possible to use any register in a group, if you ensure that T_EX's grouping mechanism will restore the register when you're done with the group, and if you are certain that other macros will not make global assignments to that register when you need it. (5) But when a register is used by several macros, or over long spans of time, it should be allocated by $\muscul \ \muscul \ \ \muscul \ \muscul \ \muscul\$

tom edge of the type. (With plain METAFONT's **beginchar** each character has a "bounding box" that runs from (0, h) at the upper left and (w, h) at the upper right to (0, -d) and (w, -d) at the lower left and lower right; variable d represents the depth of the type. The values of w, h, and d might change from character to character, since the individual pieces of type need not have the same size in a computer-produced font.)

Notice that a (code label) can appear in a **ligtable**, **charlist**, or **extensible** command. These appearances are mutually exclusive: No code may be used more than once as a label. Thus, for example, a character with a ligature/kerning program cannot also be **extensible**, nor can it be in a **charlist** (except as the final item).

they occupy in a typical production system (executable code size for dark blocks, global data size for light blocks). In this way the chart indicates a total of about $8 \times 22 = 176$ K bytes of memory, plus $8 \times 15 = 120$ K for the dynamic memory region not shown explicitly. The dynamic memory is often considerably larger in practice, because it is desirable to accommodate large macro packages and large pictures.
